

ABSTRACT OF THE DISCLOSURE
METHOD FOR MONITORING APPARATUS

A method for monitoring plural apparatus includes
5 an initialization procedure (210) and a monitoring
procedure (220). The initialization procedure (210)
includes determining subset(s) of secondary devices
respectively for primary device(s), designating
secondary device(s) as assistant device(s),
10 establishing a network topology with respect to the
primary and secondary devices, generating a set of
routing parameters that corresponds to the network
topology, and sending the set of routing parameters to
the primary and secondary devices in order to construct
15 a device network of the primary and secondary devices.
The monitoring procedure (220) includes receiving and
transmitting working reports from the plural apparatus
to a server-end device via the device network.
