

STORAGE METHOD FOR GRAPH DATA AND DISTRIBUTED COMPUTING METHOD FOR GRAPH DATA

ABSTRACT

The present specification relates to the field of data processing, and in particular,
5 to a storage method for graph data and a distributed computing method for graph data.
The graph data includes nodes and edges, the nodes include entity nodes and non-entity
nodes, and the storage method for the graph data includes: obtaining a first table and a
second table based on the graph data; obtaining first sub-tables and second sub-tables
respectively corresponding to a plurality of entity node groups; and distributing the first
10 sub-tables and the second sub-tables corresponding to the entity node groups to a
plurality of computing units for distributed storage. In the distributed computing
method for the graph data, the graph data is stored in a plurality of computing units in
a distributed way according to the storage method for the graph data, and the method
can be executed by one of the computing units.
