

LINK MONITORING METHOD AND APPARATUS

ABSTRACT

This application discloses a link monitoring method and apparatus, and belongs to the field of data transmission technologies. The method includes: receiving outer-code encoded data; performing inner-code encoding on the outer-code encoded data, and outputting inner-code encoded data; performing outer-code decoding on the outer-code encoded data; and determining, based on a status of performing outer-code decoding on the outer-code encoded data, quality of a link for transmission of the outer-code encoded data. This application can effectively monitor the quality of the link.
