CLIENT-SIDE ASYNCHRONOUS FORM MANAGEMENT

ABSTRACT

Computer programs and computer program products are provided for communicating with a web browser (10) executing on a remote/mobile processing system (5) which is temporarily and intermittently connected to a second computer (6). According to the present invention, requests from the web browser (10) to a server application accessible to the second computer are stored in a persistent request queue at the remote/mobile processing system. An interim response is provided to the web browser (10) in response to the request from the client application. The stored request may be recalled to allow user modification of the stored request prior to the request being provided to the second computer (6) for transmission to the server application.
