

ABSTRACT

MIXER FOR VISCOUS FLUID

A mixer for viscous fluid comprises a housing in which plural mixing shafts are disposed, the respective mixing shafts are provided with plural mixing units, and
5 the respective mixing units are positioned on the periphery of the mixing shaft by two assembling elements, each of the assembling elements is further provided with a paddle which is used to achieve the mixing function. While the respective mixing units are adjusted, the installation angle of the paddle can be adjusted synchronously to meet different mixing requirements, improving the degree of freedom in use.
10 Furthermore, the two assembling elements of the respective mixing units can be fixed or removed in a simple manner, greatly improving the convenience in use.
