

METHOD FOR DETECTING PROTEIN-PROTEIN INTERACTION

[ABSTRACT]

A method for detecting an interaction between a first protein and a second protein comprises the steps of:

- 5 expressing in a cell a first fusion protein comprising the first protein and an association-inducing protein, and a second fusion protein comprising the second protein and a fluorescent protein having a multimerization ability;
- 10 detecting a fluorescent focus formed by an association between the first fusion protein and the second fusion protein in the cell; and
- determining an interaction between the first protein and the second protein according to the detection of the fluorescent focus.
