

Method and apparatus for detecting child status, electronic device, and storage medium

ABSTRACT

The present disclosure provides a method and apparatus for detecting child status, an electronic device, and a computer-readable storage medium. In the present disclosure, a target picture of an interior of a vehicle cabin is acquired firstly. After that, a child in the target picture is identified. Whether the child is located on a rear seat in the vehicle cabin is determined based on position information of the child. Finally, in a case where the child is not located on the rear seat in the vehicle cabin, an alarm is issued.
