(54) Title: MACHINE TRANSLATION SYSTEM AND METHOD

**Fig. 11**

(57) Abstract: A machine or computer translation system and method which translates texts (conveying their meanings) from one natural language to another. The system and method have a modular structure for organizing languages, which in combination with a transitory (indirect) method of translation allows for the creation of a multilingual system that is capable of translations in any direction between any of the included languages. Every linguistic module includes a dictionary of words and phrases, a list of operational functions, and parameters that guide the conversion processes needed to perform a translation from one language to another. The system further utilizes an algorithm designed for a rule-based machine translation.
