

MULTI-RESULT ARTIFICIAL INTELLIGENCE SYSTEM

ABSTRACT OF THE DISCLOSURE

The multi-result artificial intelligence (AI) system includes a registration module, an initialization module, an input module, a processing module, a result generation
5 module, and a result display module. The registration module is for users to register a device type or a payment type. The initialization module is connected to the registration module, which configures multiple different AI models based on the registered device type or payment type, with each AI model being based on a Large Language Model (LLM). The input module is connected to the initialization module to receive a user
10 request. The processing module is connected to the input module for distributing the user request to the AI models. The result generation module is connected to the processing module for generating multiple results from the user request using the AI models. The result display module is connected to the result generation module to display the results.
