DESCRIPTION

NOVEL COUMARIN DERIVATIVE HAVING ANTITUMOR ACTIVITY

Technical Field

[0001] The present invention relates to a novel coumarin derivative having antitumor activity, and to a pharmaceutical composition containing the same as an active ingredient, particularly to a therapeutic agent for a cell proliferative disorder.

Background Art

[0002] It has already been revealed that coumarin derivatives, i.e., compounds which have a coumarin skeleton as a core structure, and in which the skeleton is derivatized at various positions, have different pharmacological effects depending on the position at which a chemical modification occurs (Non-patent document 31). For example, warfarin, which has antithrombogenic activity, is well known as a drug having a coumarin skeleton (Non-patent document 1). Furthermore, coumarin derivatives which exert antitumor activity by acting on various different target proteins, or coumarin derivatives which inhibit proteins associated with antitumor activity have been obtained by chemical modification at different positions of the core structure.

[0003] A coumarin derivative that exerts antitumor activity by inhibiting steroid sulfatase has been reported (Non-patent documents 2 to 6). This is currently in clinical testing. This compound forms a cycloalkyl group at the 3- and 4-positions of the coumarin skeleton, and has a sulfamate group at the 7-position. Its application to breast cancer is being considered from the viewpoint of pharmacological action.

[0004] Furthermore, as for coumarin derivatives which exert antitumor activity through binding to the estrogen receptor, a group of compounds having a characteristic substituent at the 4-position have been reported. Specifically, there have been reported a group of compounds having an arylalkyl group at the 4-position and having substituents at the 3- and 7-positions (Patent document 1), and a group of compounds in which a phenyl group is directly bound to the skeleton at the 4-position, and which have a phenoxy group at the 3-position (Patent document 2).

Also, as for a coumarin derivative exhibiting Raf inhibitory activity and exhibiting antitumor activity in cells, a compound having a 6-pyrazinyloxy group at the 7-position has been reported (Patent document 5).

[0005] In addition, known are several coumarin derivatives whose target proteins are unknown, and which are reported to exhibit antitumor activity. These include a group of compounds derived from natural sources (Non-patent documents 7 to 12), and a group of new compounds obtained by chemical synthesis (Non-patent documents 13 to 23, 32 to 34). As for the new compounds obtained by chemical synthesis, there have been reported, for example: a compound having alkoxy groups at the 5-, 6- and 7-positions of the coumarin skeleton (Non-patent document 13); a compound having an alkoxy group only at the 7-position of the coumarin skeleton (Non-patent document 14); a compound having an enone functional group at the 6- or 7-position of the coumarin skeleton (Non-patent document 15); a compound having a methyl group at the 4-position of the coumarin skeleton, and substituents at the 7- and 8-positions (Non-patent document 16); a

compound having substituents at all of the 4-, 5-, 6-, 7- and 8-positions of the coumarin skeleton (Non-patent document 17); a compound in which an amide group, ester group or sulfonamide group is directly bound to the coumarin skeleton at the 3-position, and which has a substituent at the 6- or 8-position (Non-patent documents 18 and 19); a compound in which an amide group is directly bound to the coumarin skeleton at the 3-position, and which has a substituent at the 7-position (Patent document 3 and Non-patent document 20); a compound having substituents at the 6- and 7-positions of the coumarin skeleton (Non-patent document 21); a compound having a hydroxy group at the 7-position of the coumarin skeleton, and a nitro group at an appropriate position of the 3-, 6- and 8-positions (Non-patent documents 22 and 23); and a compound having a methoxy or hydroxy group at the 7-position of the coumarin skeleton, a phenyl group at the 3-position, and a substituent at the 4-position.

There have also been reported: a compound having a substituent with a nitrogen atom (diethylamino group, etc.) at the 7-position, a cyano group at the 4-position, and a heteroaryl group at the 3-position (optionally with no substituent at the 4-position) (Non-patent document 32); and a compound having a heteroaryl group at the 3-position, and a methyl group, halogen atom, nitro group, etc. at the 6-, 7- or 8-position (Non-patent document 33). There have also been reported examples of using a compound with a coumarin structure as a ligand for a Pd compound having antitumor activity in cells (Non-patent document 34).

[0006] As for compounds which exhibit target protein inhibitory activity, and which are likely to have antitumor activity despite the

absence of a report dealing with their antitumor activity, there have been reported coumarin derivatives exhibiting TNFα inhibitory activity (Patent document 4 and Non-patent documents 24 to 28), aromatase inhibitory activity (Non-patent document 29), MEK inhibitory activity (Non-patent document 30), or the like. In compounds mentioned in these reports, the substituents are located at the 3-, 4-, 6- or 7-position of the coumarin skeleton.

[0007] As described above, although several coumarin derivatives having antitumor activity are known, few of the compounds exhibit a sufficiently high antitumor activity to put it to practical use as an anticancer drug. Therefore, more practical compounds having sufficiently high antitumor activity are still strongly sought.

[0049] Examples of manufacturing processes for the compound or salt according to the present invention will now be explained. In each of the manufacturing processes explained hereafter, the order of steps may be changed as may be necessary. Furthermore, when a reactant in a

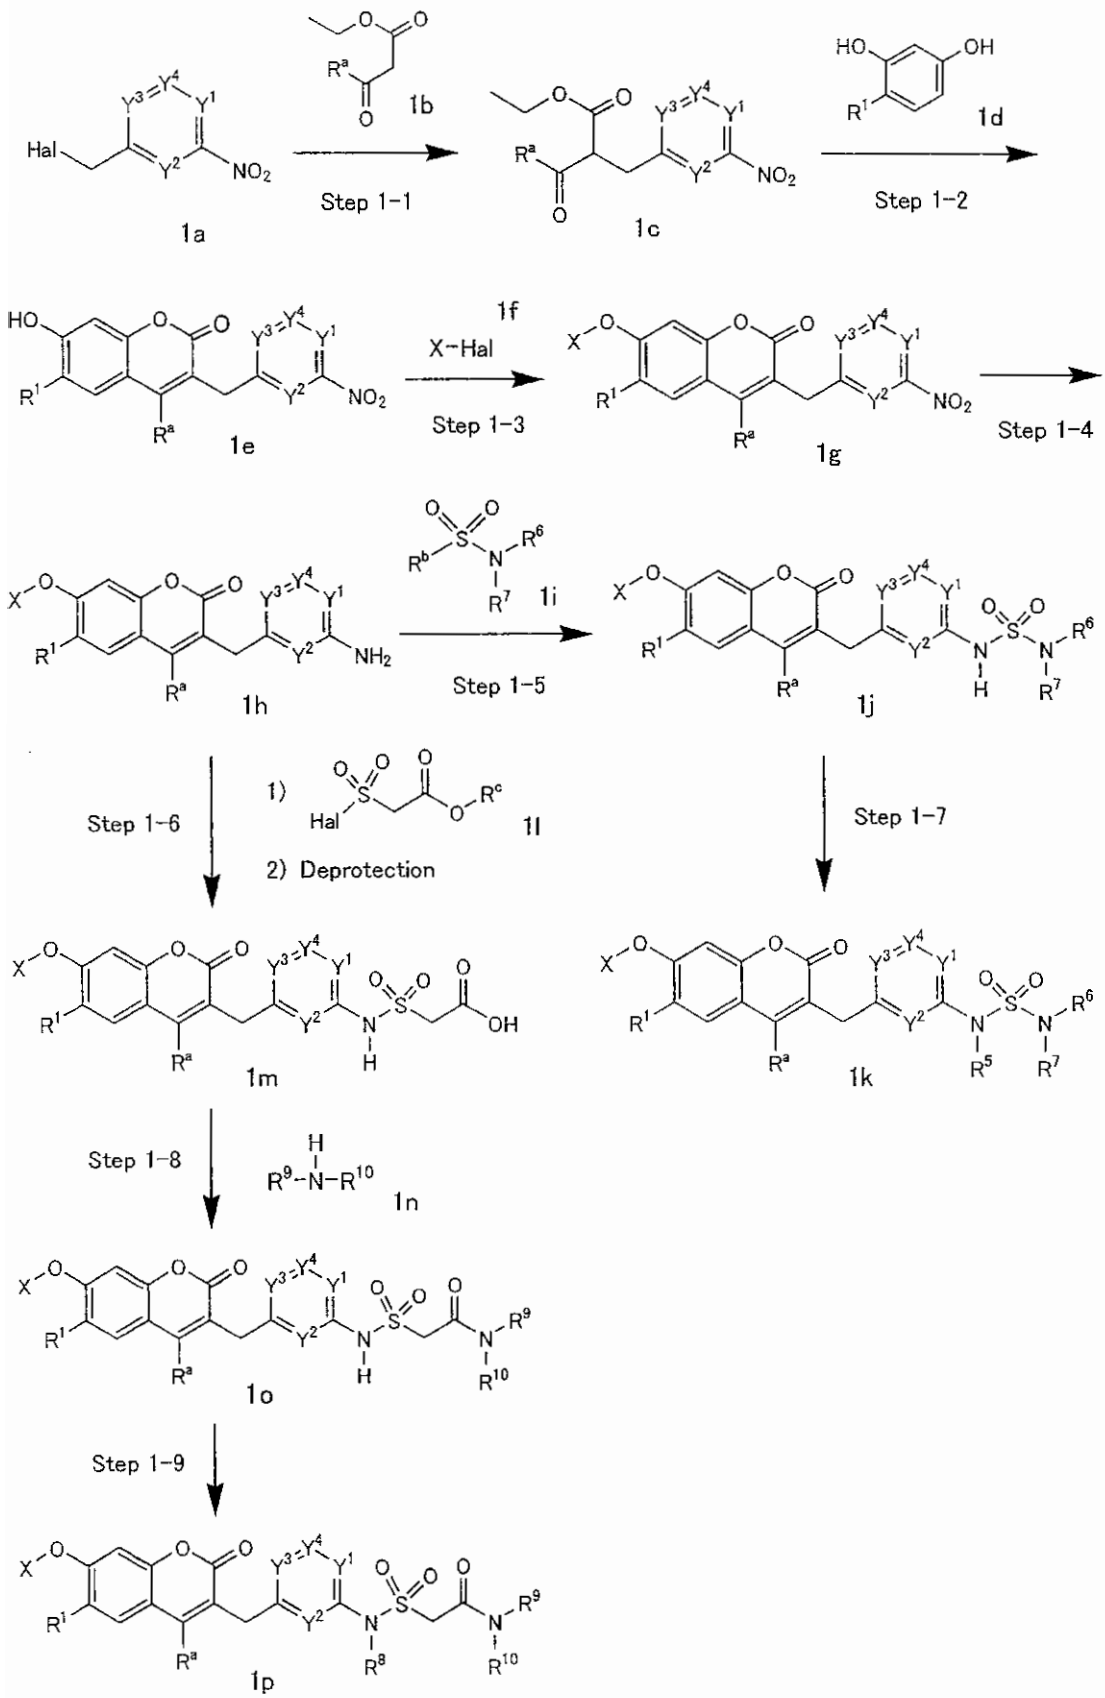

certain step is subjected to an undesired chemical conversion under reaction conditions for the step, the manufacturing process may be carried out by, for example, performing protection and deprotection of a functional group. For selection of a protecting group and a method of protection and deprotection, there may be referred to, for example, T. W. Greene, P. G. M. Wuts, Protective Groups in Organic Synthesis, Second Edition, John Wiley and Sons, Inc., New York, 1991.

[0050] X, Y^1, Y^2, Y^3, Y^4, R^1, R^5, R^6, R^7, R^8, R^9 and R^{10} have the same meanings as mentioned above, while Hal represents a halogen atom; R^a represents a C_{1-6} alkyl group (the C_{1-6} alky group may be substituted with a substituent selected from the group consisting of a fluorine atom, an optionally protected hydroxy group, an optionally protected oxo group, and an optionally protected carboxy group); R^b represents a leaving group, such as a halogen atom or 2-oxazolidinon-3-yl group; R^c represents a protecting group for the carboxy group, such as a C_{1-4} alkyl group; R^d and R^e are the same or different, and each independently or together represent a protecting group for the amino group; R^f represents a C_{1-4} alkyl group; R^g represents a hydroxy group or halogen atom; R^h represents a methyl group or R^cOCO-; R^i represents a hydrogen atom or C_{1-5} alkyl group; and B represents a nitro group or $-NR^dR^e$.

These salts are produced by contacting the compound with an acid or base usable for production of pharmaceutical products. Examples of the salts include: inorganic acid salts such as hydrochlorides, hydrobromides, hydroiodides, sulfates and phosphates; sulfonates such as methanesulfonates, benzenesulfonates and toluenesulfonates; carboxylates such as formates, acetates, oxalates, maleates, fumarates, citrates, malates, succinates, malonates, gluconates, mandelates, benzoates, salicylates, fluoroacetates, trifluoroacetates, tartrates, propionates and glutarates; alkali metal salts such as lithium salts, sodium salts, potassium salts, cesium salts and rubidium salts; alkaline earth metal salts such as magnesium salts and calcium salts; and ammonium salts such as ammonium salts, alkylammonium salts, dialkylammonium salts, trialkylammonium salts and tetraalkylammonium salts. Among them, alkali metal salts such as lithium salts, sodium salts, potassium salts, cesium salts and rubidium salts are preferred, and sodium salts and potassium salts are particularly preferred.

[0141] The compound or pharmaceutically acceptable salt thereof according to the present invention can be used for treatment of a cell proliferative disorder, particularly cancer, by appropriately

administering to the patient a pharmaceutically effective amount thereof by itself or in the form of a pharmaceutical composition. As for the administration route, there may be used: systemic administration such as oral administration, rectal administration, intravenous administration, intramuscular administration, subcutaneous administration, intracisternal administration, vaginal administration, intraperitoneal administration, intravesical administration or inhalation administration; or topical administration in the form of an ointment, gel, cream or the like.

[0142] When the compound or pharmaceutically acceptable salt thereof according to the present invention is used in the form of a pharmaceutical composition, it is generally prepared as a certain formulation (dosage form). As for the formulation, there may be mentioned, for example, a tablet, a capsule, a granule, a powder, a fine granule, a pill, and an aqueous or nonaqueous solution and suspension. Furthermore, the compound or salt may be used in the form of various controlled-release formulations, and as for the controlled-release formulation, there may be mentioned, for example, a formulation used implanted in the body, and a formulation applied to the oral or nasal mucosa. The solution or suspension may be stored filled in a container suited for the preparation of a single dose.

[0143] Various formulations as mentioned above may be produced by a known method, by mixing the compound or salt with a pharmaceutically acceptable additive. As for the additive, there may be mentioned an excipient, a lubricant (coating agent), a binder, a disintegrant, a stabilizer, a flavoring agent, a base, a dispersant, a diluent,

a surfactant, an emulsifier, and the like.

[0144] As for the excipient, there may be mentioned, for example, starches (starch, potato starch, maize starch and the like), lactose, crystalline cellulose, and calcium hydrogen phosphate.

As for the lubricant (coating agent), there may be mentioned, for example, ethyl cellulose, hydroxypropyl cellulose, hydroxypropylmethyl cellulose, shellac, talc, carnauba wax, and paraffin.

As for the binder, there may be mentioned, for example, polyvinylpyrrolidone and macrogol, as well as the same compounds as mentioned for the excipient.

As for the disintegrant, there may be mentioned, for example, chemically modified starches and celluloses, such as croscarmellose sodium, sodium carboxymethyl starch, and crosslinked polyvinylpyrrolidone, as well as the same compounds as mentioned for the excipient.

As for the stabilizer, there may be mentioned, for example: paraoxybenzoic acid esters such as methylparaben and propylparaben; benzalkonium chloride; phenols such as phenol and cresol; thimerosal; dehydroacetic acid; and sorbic acid.

As for the flavoring agent, there may be mentioned, for example, sweeteners, acidulants and fragrances which are commonly used.

As for the base, there may be mentioned, for example: fats such as lard; vegetable oils such as olive oil and sesame oil; higher alcohols such as stearyl alcohol and cetanol; animal oils; lanolin acid; vaseline; paraffins; bentonite; glycerine; and glycol oils.

As for the dispersant, there may be mentioned, for example, cellulose derivatives (gum arabic, tragacanth, methyl cellulose and the like), stearic acid polyesters, sorbitan sesquioleate, aluminum monostearate, sodium alginate, polysorbates, and sorbitan fatty acid esters.

As for the solvent or diluent in a liquid formulation, there may be mentioned, for example, phenol, chlorocresol, purified water and distilled water.

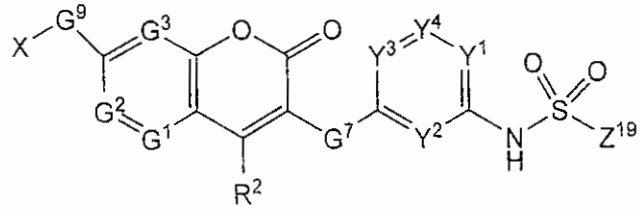

As for the surfactant or emulsifier, there may be mentioned, for example, polysorbate 80, polyoxyl 40 stearate, and lauromacrogol.

[0145] The preferred content of the compound or pharmaceutically acceptable salt thereof according to the present invention in the formulation varies depending on the dosage form, and is generally 0.01% to 100% by weight.

[0146] When the compound or pharmaceutically acceptable salt thereof according to the present invention is used as a therapeutic agent for a cell proliferative disorder, the dose can be appropriately determined depending on the severity of symptom, age, body weight, relative health condition, presence or absence of concomitant drugs, administration route, and the like. For example, when the subject is a warm-blooded animal, particularly human, the dose per kilogram of body weight per day for oral administration is preferably 0.00001 to 5000 mg, more preferably 0.0001 to 10 mg. The dose for parenteral administration is also preferably 0.00001 to 5000 mg, more preferably 0.0001 to 10 mg. The dose as mentioned above may be given once every day to once every 3 weeks, or daily in 2 to 4 divided doses.

[0147] As described above, the compound or pharmaceutically acceptable salt thereof and pharmaceutical composition according to the present invention may be used as a therapeutic agent for a cell proliferative disorder, particularly cancer. As for the cancer, there may be mentioned, for example: blood cancers and lymphoid cancers, such as leukemias (acute myelocytic leukemia, acute lymphocytic leukemia, chronic myelocytic leukemia, chronic lymphocytic leukemia, and the like), malignant lymphomas (Hodgkin's disease, non-Hodgkin's lymphoma, and the like), multiple myeloma, and myelodysplastic syndrome; and solid cancers, such as brain tumor, glioma, head and neck cancers (pharyngeal cancer, laryngeal cancer, tongue cancer, and the like), esophageal cancer, gastric cancer, colorectal cancer, lung cancer (small cell lung cancer, non-small cell lung cancer, or the like), thyroid cancer, breast cancer, gallbladder cancer, pancreatic cancer, liver cancer, prostate cancer, ovarian cancer, uterine cancer, testicular cancer, renal cell carcinoma, bladder cancer, renal pelvic and ureteral cancer, malignant melanoma, and skin cancer.

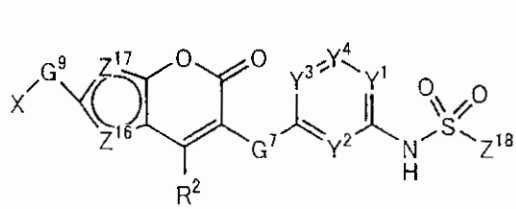

As examples of the compound or pharmaceutically acceptable salt thereof according to the invention, there may be mentioned compounds represented by the following formulas and their pharmaceutically acceptable salts:

[0148] Exemplified embodiments of the present invention will now be described more specifically based on examples (manufacturing examples and testing examples).

[0149] [Manufacturing examples]

In the following manufacturing examples (synthetic examples), NMR analysis was performed using JNM-EX270 (270 MHz) manufactured by JEOL, JNM-GSX400 (400 MHz) manufactured by the same, or ARX-300 (300 MHz) manufactured by Bruker, NMR data were shown in ppm (parts per million, δ), and the deuterium lock signal

from the sample solvent was used as a reference.

Further, mass spectral data were obtained using JMS-DX303 manufactured by JEOL, or JMS-SX/SX102A manufactured by the same, or using Micromass (Navigator manufactured by Finningan) equipped with gradient high performance liquid chromatograph Agilent 1100 manufactured by Agilent Technologies.

When reagents available on the market were used, they were used directly in the reaction without pretreatment such as distillation or recrystallization. The used reaction solvents were anhydrous when they are available on the market.

In the meantime, all chemical reactions were performed under nitrogen atmosphere.

As used herein, "solvent was distilled away" means that solvent was distilled under reduced pressure using a rotary evaporator.

When a compound of sufficiently high purity cannot be obtained by standard synthesis protocols, separation and purification by silica gel chromatography, alumina gel chromatography or the like may be carried out as necessary to obtain a compound of higher purity.

[0270] Compound 1o-2-4-2:

2-{2-Fluoro-3-[4-methyl-2-oxo-7-(pyrimidin-2-yloxy)-2H-1-benzopyran-3-ylmethyl]phenylsulfamoyl}-N-methyl-acetamide

[Chemical Formula 130]

[0271] Step 1 (Preparation of THF solution of compound 1l-1):

2-Propanol (130 μL, 1.69 mmol) was added to a solution of chlorosulfonyl acetyl chloride (1180 μL, 1.69 mmol) in THF (3 mL) at 0°C under nitrogen atmosphere, and the mixture was stirred at 0°C for 20 minutes. The mixture was further stirred at room temperature for 2 hours to yield a THF solution of compound 1l-1 quantitatively.

[0272] Step 2 (Synthesis of compound 1m-2-4):

A THF solution of compound 1l-1 obtained in step 1 (1.04 mL, 0.585 mmol) was added dropwise under nitrogen atmosphere to a

solution of compound 1h-2-4 (214.4 mg, 0.568 mmol) and diisopropylethylamine (228 μL, 1.306 mmol) in THF (8 mL). After stirring at room temperature for 40 minutes, a solution of sodium hydroxide (46.9 mg, 2.346 mmol) in water (8 mL), and methanol (0.5 mL) were added, and the mixture was stirred for 1 hour. Ethyl acetate (40 mL) was then added to the reaction solution, and the solution was washed twice with 1N hydrochloric acid (20 mL) and once with saturated saline (30 mL). The resultant organic layer was dried over sodium sulfate, and the solvent was distilled away under reduced pressure. The resultant residue was purified by silica gel chromatography (dichloromethane: methanol = 10: 1) to yield compound 1m-2-4 (65.9 mg, 23%) as a pale yellow solid.

ESI (LC/MS positive mode) m/z: 500 (M + H).

[0273] Step 3 (Synthesis of compound 1o-2-4-2):

A 2.0 M methylamine THF solution (96 μL, 0.192 mmol) and diisopropylethylamine (22.3 μL, 0.128 mmol) were added thereto, and the mixture was stirred at room temperature under nitrogen atmosphere for 19 hours. Ethyl acetate (20 mL) was then added to the

reaction solution, and the solution was washed twice with 1N hydrochloric acid (20 mL), three times with saturated sodium hydrogen carbonate solution (20 mL) and further once with saturated saline. The resultant organic layer was dried over sodium sulfate, and the solvent was distilled away under reduced pressure. The resultant residue was purified by silica gel column chromatography (methylene chloride: methanol = 10: 1) and the title compound (9 mg, 28%) was obtained as a white solid.

Ethyl acetoacetate (109.6 μL, 0.86 mmol) was dissolved in THF (2.0 mL), and 2-(di-t-butoxycarbonyl)amino-4-(bromomethyl)pyridine (which had been obtained by the method described in Bioorganic & Medicinal Chemistry Letters 2004, 14, 2227-2231) and NaH (39.0 mg, 0.97 mmol) were added thereto. The mixture was stirred at room temperature for 12 hours. Water was then added to the reaction solution, and the solution was extracted with ethyl acetate. After washing with sodium hydrogen carbonate solution and saturated saline, the organic layer was dried over anhydrous magnesium sulfate, and the solvent was distilled away under reduced pressure. The resultant residue was purified by silica gel column chromatography to yield the title compound (206.2 mg, 83%).

(Testing example 1: Measurement of cell proliferation inhibitory activity)

The cell proliferation inhibitory activities of the compounds and salts shown in Tables 1-1, 1-2 and Table 2 were measured as follows, using the human colon cancer cell line HCT116 (American Type Culture Collection, VA, USA). 2000 to 3000 cells per well of the human colon cancer cell line HCT116 was placed in a 96-well culture plate, a predetermined concentration (0.00038 μM, 0.00076 μM, 0.0015 μM, 0.0031 μM, 0.0061 μM, 0.012 μM, 0.024 μM, 0.049 μM, 0.098 μM, 0.195 μM, 0.39 μM, 0.78 μM, 1.56 μM, 3.13 μM, 6.25 μM, 12.5 μM, 25 μM or 50 μM) of the test substance was added thereto, and the mixture was then incubated at 37°C under 5% CO_2 environment for 4 days. On day 4 of incubation, the Cell Counting Kit-8 solution (Dojindo Laboratories) was added, the absorbance (measurement wavelength: 450 nm; reference wavelength: 615 nm) was measured following the protocol attached to the kit, and the 50% proliferation inhibitory concentration (IC50) was calculated. The results are shown in Tables 1-1, 1-2 and Table 2.

[0326] (Testing example 2: Calculation of AUC value)

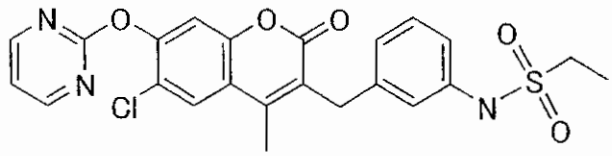

The AUC (area under the blood concentration-time curve) values of the compounds and salts shown in Table 2 (only compound 1j-2-16-2 is Na salt; the others are free form) were calculated by administering the test substance to an animal and measuring its concentration in plasma. As the animals, BALB/c (nu/nu) mice (4 to 6 weeks old) procured from Japan Charles River Laboratories were used

after a one-week taming period. As for the test substances other than Comp. 1, 5 mg/mL of the substance solution was given at 0.2 mL/ 10 g body weight (dose of the test substance: 100 mg/kg body weight). As for Comp. 1, 10 mg/mL of the substance solution was given at 0.2 mL/ 10 g body weight (dose of the test substance: 200 mg/kg body weight). Administration of the substance solution to a mouse was performed forcibly using an oral feeding tube. Blood was collected from the eye pit 15 minutes, 2 hours, 7 hours and 24 hours after administration of the substance solution, using a hematocrit tube treated with heparin. Paraoxon (final concentration: 1 mM) was added to the collected blood as a stabilizer, the mixture was centrifuged at 10000 rpm for 3 minutes, and plasma was separated. The plasma was stored in a freezer set to −80°C until the time of measurement. The measurement was carried out as follows. 100 μL of distilled water to which the internal standard substance (a structural homolog, concentration adjusted appropriately depending on the compound used) had been added was added to 5 μL of the plasma, and then, a measurement sample was prepared through solid phase extraction processing using an Oasis HLB μElution Plate (Waters), and was analyzed by LC/MS/MS. The plasma concentration was calculated using a calibration curve prepared based on the ratio of standard substance to internal standard substance in control plasma of mice. The AUC was calculated from the data of plasma concentration of the drug by the trapezoidal method using Microsoft Excel 2003 (Microsoft). The results are shown in Table 2.

[0332] As seen in Tables 1-1, 1-2 and Table 2, the compound or salt according to the present invention exhibited a markedly smaller IC50 value than conventional compounds, or exhibited a sufficiently small IC50 value, and a larger AUC value than conventional compounds. This suggests that the compound or salt according to the present invention has markedly high antitumor activity compared to conventional compounds, or that it has sufficiently high antitumor activity that is equivalent to those of conventional compounds, and exhibits higher systemic exposure than conventional compounds.

[0333] From Testing examples 1 and 2, it has been revealed that the compound or pharmaceutically acceptable salt thereof according to the present invention is effective as a therapeutic agent for cell proliferative disorders, particularly cancers.
