

ABSTRACT

ELECTRIC COOKER

The present invention provides a inexpensive electric cooker in which a different-height upper or lower die is properly mounted without necessity of replacing a hinge or upper and lower housings or of manufacturing an electric cooker exclusively used for each baked product.

The electric cooker comprises a lower housing 1; a lower die 7 mounted on the the lower housing 1; an upper housing 5 pivotally mounted at the rear end via a hinge shaft 4 to the lower housing 1 to turn upward from the lower housing 1 upward; an upper die 8 mounted on the upper housing, a lower surface of the upper die being capable of being disposed in an upper surface of the lower die; an electric heater disposed in at least one of the lower housing 1 and upper housing 5 and heating at least one of the lower die 7 and the upper die 8 from back to heat dough for bread or the like between the lower die and the upper die; and hinge-shaft height adjusting means 6 changing a vertical position of the upper housing 5 pivotally mounted via the hinge shaft by adjusting height of the hinge shaft.
