

Abstract

Switching Method, Network Device and Terminal Device

5 The present application discloses a handover method, a network device, and a terminal device. The method includes: a first network device acquires measurement results of links, wherein the links include a link between the first network device and a first terminal device and a link between the first network device and a second terminal device; and the first network device determines a first handover scheme of the first terminal device and/or a second handover
10 scheme of the second terminal device according to the measurement results. Thus effective relay transmission can be continuously performed between a Relay UE and a Remote UE after the Relay UE and the Remote UE perform cell handover.
