

WIRELESS COMMUNICATION METHOD, TERMINAL DEVICE, AND NETWORK DEVICE

ABSTRACT

The embodiments of the present application provides a wireless communication method and a wireless communication device, which can enable a network device to timely know the power used by the terminal device for transmitting services, so that the service can be correctly demodulated. The method includes: determining, by a terminal device, power information for performing uplink transmission of a first service in a first time period, wherein the terminal device simultaneously performs uplink transmission of the first service and at least one second service in the first time period; and sending, by the terminal device, the power information to a network device in the uplink transmission of the second service performed in the first time period.
