ABSTRACT

DELIVERY CONTAINER

The delivery box (10) has shock absorbing function and is capable of reducing a required space for transporting. The delivery container (10) comprises a first container section (20) and a second container section (40) which are made of a shock absorbing material and which have accommodating portions, in which articles to be transported can be accommodated. Number of accommodating the articles in the first container section (20) is equal to that in the second container section (40). The vacant second container section (40) can be fitted into the accommodating portion of the vacant first container section (20) in a state that the both accommodating portions are faced each other.
