

ABSTRACT

Disclosed are a method and an apparatus for filling data in a table, an electronic device and a storage medium. The method for filling data in a table includes: determining a target copy range in a first table in response to a copy operation on the first table; determining a paste cell corresponding to each copy cell in the target copy range in a second table, in which the copy cell and the corresponding paste cell have at least one associated target parameter; and filling cell data in the copy cell into the corresponding paste cell.
