PRODUCT INFORMATION MANAGEMENT DEVICE

ABSTRACT

To generate a product master database updated to the latest information.

A product information management device includes: storage means that stores, for each product, product identification information, first item information, and second item information in association with each other; means that extracts, from an image medium, one piece of product identification information and first item information by image recognition processing; means that accesses a database stored in an external device and extracts one piece of product identification information and second item information; means that determines whether the first item information and the second item information associated with the extracted one piece of product identification information match the first item information and the second item information associated with one piece of product identification information stored in the storage means; and means that, in a case where the means determines that the first item information and the second item information do not match, issues a notification to that effect and replaces the first item information and the second item information associated with the one piece of product identification information stored in the storage means with the first item information and the second item information associated with the extracted one piece of product identification information.
