

ABSTRACT

An electronic apparatus comprising an auxiliary storage includes a tray (4) in which an auxiliary storage (2) is fixed, a compartment (3) that houses the tray (4) inserted from the front of a rectangular opening (1a) in the front face of a housing (1), a pair of first movable plates (6a) and (6b) horizontally rotatably provided at both rear corner ends of the compartment (3), and a connector attachment plate (9) provided to a rear side face of the compartment (3). Both rear corner ends of the tray (4) press respective first rotational faces (C1) of the pair of first movable plates (6a), and a vibration impact absorption member (7) attached to a second rotational face (C2) that rotates together with a first rotational shaft (C1) presses a side face of the tray (4).
