

ABSTRACT

HttpDNS SCHEDULING METHOD, APPARATUS, MEDIUM AND DEVICE

Disclosed are a method, apparatus, medium and device for HttpDNS scheduling. The scheduling method includes: receiving a domain name resolution request from a client, the domain name resolution request including a customized parameter related to accessing resources; resolving the domain name resolution request and determining a target server based on the customized parameter; and returning an IP address of the target server to the client, so that the client can access the target server. By rational planning of various service resources, refined scheduling is realized, so as to rationally utilize service resources, avoid waste of resources and improve the quality of the service.
