

INFORMATION PROCESSING APPARATUS, INFORMATION PROCESSING
METHOD, AND PROGRAM

ABSTRACT OF THE DISCLOSURE

An information processing apparatus provided with a plurality of different colored power generation elements includes: a display unit displaying a plurality of pieces of information each denoting processing that is performed when one of the power generation elements is selected by a user using the same color as that of the selected power generation element; a plurality of voltage detection units each detecting a voltage of power generated by a corresponding one of the power generation elements; a determination unit specifying at least one of the power generation elements whose power generation efficiency is different from that of the other power generation elements on the basis of the detected voltage of power generated by each of the power generation elements, and determining that the specified power generation element is a target that has been selected and operated by the user; and a processing unit performing processing corresponding to the target.
