

TAPE CARRYING ACTIVE AGENT-CONTAINING FINE POWDER

ABSTRACT

The present invention relates to a tape (1) carrying an active agent-containing fine powder (12) on one surface (13) of a base by a binder and to a method for vaporizing the active agent by heating the tape (1). In particular, the tape (1) of the present invention has an excellent storage stability for a long time even for any volatile active agent having high vapor pressure because the active agent does not easily volatilize during the storage. The active agent can be an insecticide, a bactericide or a fungicide. The tape (1) preferably passes between two spools (2) over a heater (6).
