(54) Title: SYSTEM AND METHOD FOR SYNCHRONISING LIGHTING EVENT AMONG DEVICES

FIG. 1

(57) Abstract: There is a system comprising: a first device configured to display video data, detect a lighting profile for a first plurality of lighting colours produced by the first device, and generate information about the lighting profile; a video synchronisation server configured to transmit the video data being displayed on the first device to a second device; the second device configured to display the video data; and a lighting synchronisation server configured to receive the information from the first device. The video synchronisation server is configured to control the lighting synchronisation server to transmit the information with a timestamp to the second device, so that the second device is capable of selectively producing a second plurality of lighting colours based on the information and the produced second plurality of lighting colours are matched with the video data being received from the video synchronisation server.
