

ABSTRACT

The present application discloses a method and device for outputting risk information and constructing risk information, to resolve a problem that risk information output in the existing technology has poor applicability to different
5 owners of a service. The method for outputting risk information includes the following: determining, based on a predetermined risk control rule and/or risk control model that include/includes one or more risk factors, a risk factor that corresponds to a risk control decision result of a service from the risk factors; determining a risk information set that corresponds to the corresponding risk factor, where the
10 corresponding risk information set includes multiple levels of risk information with different refinement degrees, and the risk information is used to explain a cause of the risk control decision result; determining one or more levels of risk information with refinement degrees that match a risk information requirement level of a service owner from the multiple levels of risk information based on the risk information requirement
15 level of the service owner; and outputting the determined risk information, so that the service owner obtains the determined risk information.
