

Abstract

Disclosed in embodiments of the present disclosure is a mobility management method for a terminal device, which can be applied to the technical field of communications. The method executed by a terminal device comprises: receiving information for the conditional mobility sent by a network device, and then executing the conditional mobility according to the satisfaction condition of the execution condition of the conditional mobility. Therefore, the corresponding conditional mobility is selectively executed according to the satisfaction condition of the execution condition of the conditional mobility, so that the reliability, accuracy or robustness of mobility management is improved.
