

LOWER LEG MASSAGER

ABSTRACT

Provided is lower leg massager (1) that includes mechanism to enable movement of treatment member when massaging target areas of lower leg, that allows treatment element mounted to the treatment member to be firmly pressed against the target areas, and that achieves effective massage.

The lower leg massager (1) comprises vertical massage mechanism (4) to move vertically for performing massage operation on calf (C) and shin (S), i.e. treatment target areas. The vertical massage mechanism (4) includes: outer treatment member (7) which covers and presses the lateral side of the shin (S); rear treatment member (8), disposed inwardly of the outer treatment member (7) so as to lie behind the calf (C), for pressing the back side of the calf (C); and pressing mechanism (10) to enable pressing massage to the target areas by varying the position of one of the outer treatment member (7) and the rear treatment member (8).
