FIG. 1

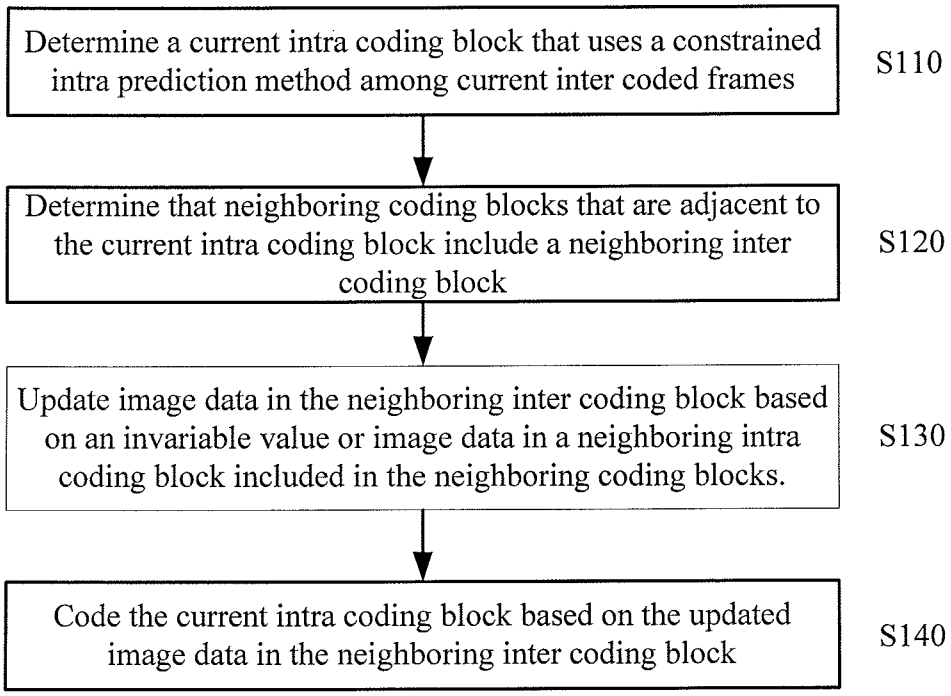

Determine a current intra coding block that uses a constrained intra prediction method among current inter coded frames
S110
Determine that neighboring coding blocks that are adjacent to the current intra coding block include a neighboring inter coding block
S120
Update image data in the neighboring inter coding block based on an invariable value or image data in a neighboring intra coding block included in the neighboring coding blocks.
S130
Code the current intra coding block based on the updated image data in the neighboring inter coding block
S140

FIG. 4

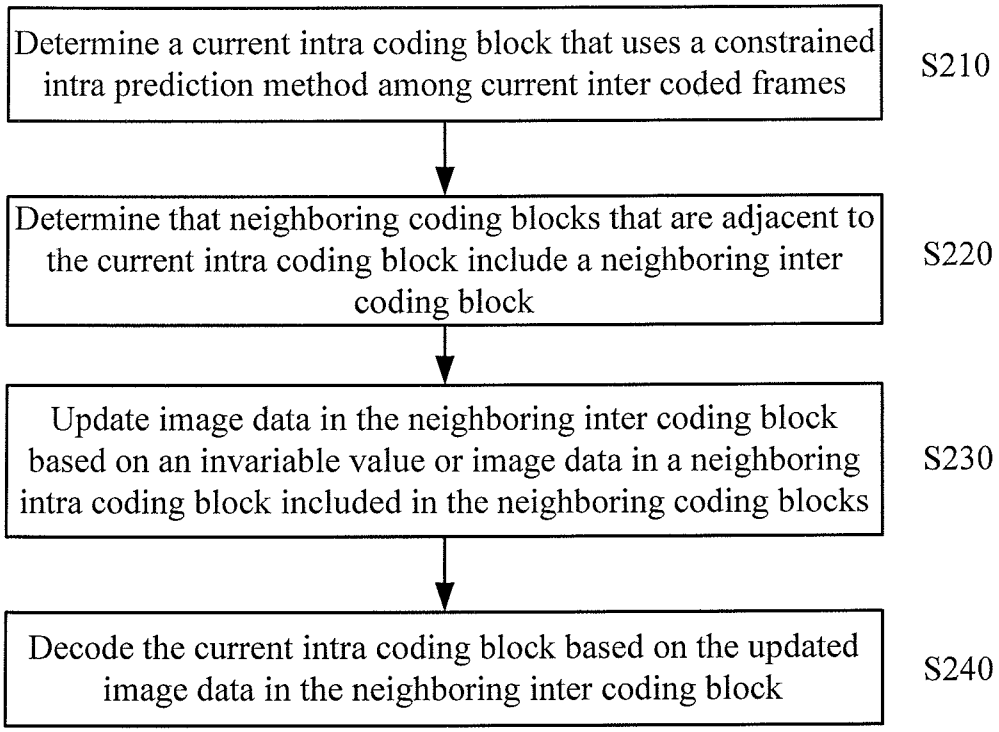

Determine a current intra coding block that uses a constrained intra prediction method among current inter coded frames
S210
Determine that neighboring coding blocks that are adjacent to the current intra coding block include a neighboring inter coding block
S220
Update image data in the neighboring inter coding block based on an invariable value or image data in a neighboring intra coding block included in the neighboring coding blocks
S230
Decode the current intra coding block based on the updated image data in the neighboring inter coding block
S240

FIG. 5

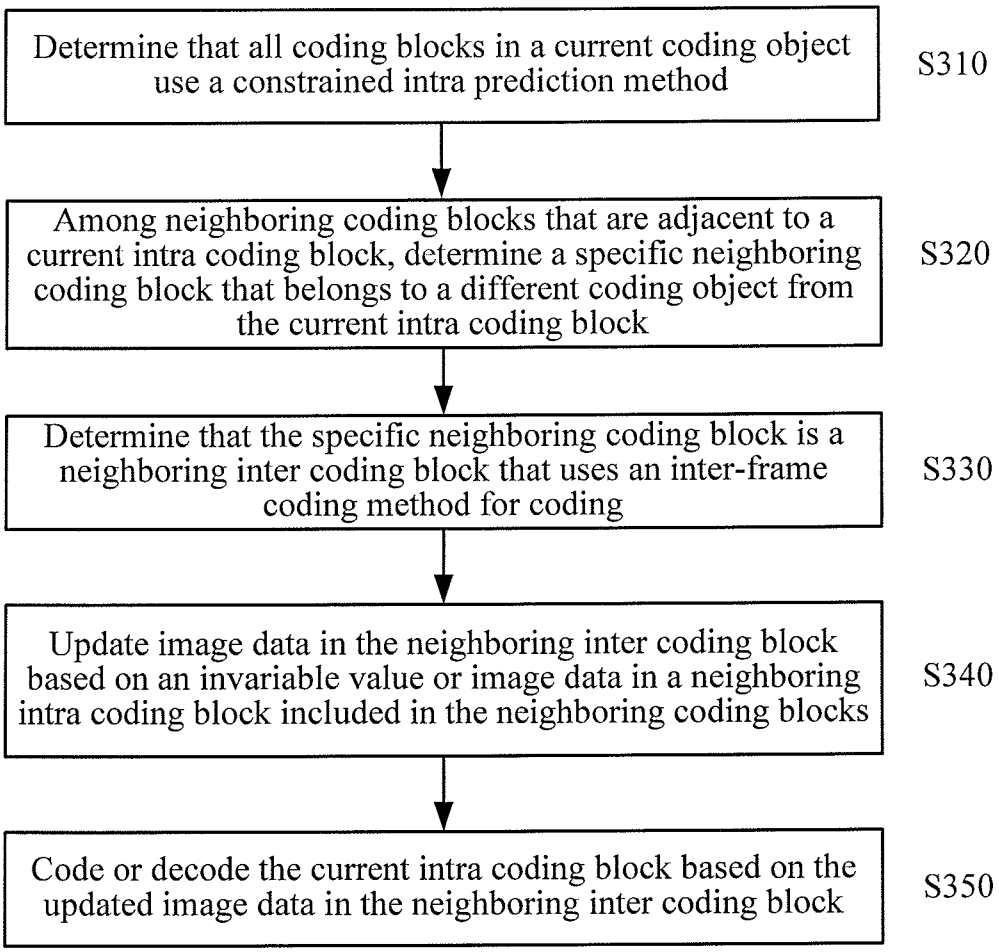

Determine that all coding blocks in a current coding object use a constrained intra prediction method
S310
Among neighboring coding blocks that are adjacent to a current intra coding block, determine a specific neighboring coding block that belongs to a different coding object from the current intra coding block
S320
Determine that the specific neighboring coding block is a neighboring inter coding block that uses an inter-frame coding method for coding
S330
Update image data in the neighboring inter coding block based on an invariable value or image data in a neighboring intra coding block included in the neighboring coding blocks
S340
Code or decode the current intra coding block based on the updated image data in the neighboring inter coding block
S350
