

WASHING MACHINE

ABSTRACT

5 A washing machine includes a detergent case that is provided with a
first storage chamber in which a detergent is stored, and a channel structure
part that forms a channel above the detergent case. The channel structure
part is provided with a plurality of dropping holes that direct water from the
channel toward the detergent case. The detergent case includes a separation
10 wall that separates the first storage chamber into a mixing chamber where the
detergent and the water are mixed to produce a solution of the detergent, and
a foaming chamber where the solution flowing from the mixing chamber is
foamed. The plurality of dropping holes include a first dropping hole that
directs the water toward the mixing chamber, and a second dropping hole that
15 directs the water toward the foaming chamber.
