TRANSPORT FACILITY

ABSTRACT

A transport facility includes a transport vehicle 1 that transports a transport article along a movement path P, a movable object 2 including a communication device that performs wireless communication with the transport vehicle 1 being within a communication range and movable separately from the transport vehicle 1, and a movable object controller that controls the movable object 2. The movable object controller causes, in response to determining that the transport vehicle 1 is faulty, the movable object 2 to be within the communication range of the transport vehicle 1 and causes the communication device to transmit, to the transport vehicle 1, a recovery command for recovery of the transport vehicle 1.
