

ABSTRACT

In an ozone generation device of an embodiment, a first electrode unit is provided on an inner face of a discharge tube having a cylindrical shape. A second electrode unit is provided outside the discharge tube at an interval, and faces the first electrode unit. A fuse includes an outer face, a diameter of the outer face is smaller than a diameter of the inner face, the fuse has a cylindrical shape, at least a part of the outer face being positioned inside the discharge tube. A fuse holder is formed substantially in a C shape as well as in a plate shape, is interposed between the discharge tube and the fuse, the fuse holder includes the outer periphery and an inner periphery and is provided with a first opening and a second opening, the outer periphery extends in an arc along the inner face to come into contact with the inner face, the inner periphery extends in an arc along the outer face to come into contact with the outer face, the first opening is positioned on a side of an axial center of the inner periphery to receive the fuse, the second opening opens the first opening outwardly in a radial direction of the axial center.
