## ABSTRACT

# SYSTEM FOR DETECTING AND MANAGING FAKE WEBSITES IN A COMPUTING ENVIRONMENT

A system and method for detecting and managing fake websites (106) in a computing environment (100) is disclosed. The present system provides a mechanism for a user to verify whether a website is original or duplicate. Further, the present system provides a process to combine multiple information of the website to decide probability of the website to be fake. Furthermore, the present system provides notification to a website owner (316) about existence of a duplicate website (106). The present system interfaces with external entities and is adaptable to diverse platforms, offering a robust solution to combat online threats such as, for example, but not limited to, phishing attacks.
