

ABSTRACT OF THE DISCLOSURE

MOTOR-DRIVEN MOVABLE RACK SYSTEM

A motor-driven movable rack system comprises a plurality of motor-driven movable racks, a control unit that controls the movement of movable racks in response to a command signal in order to form a working space in front of a desired movable rack, and monitoring units what are installed together with the movable rack system and at a remote location. The monitoring unit at the remote location can recognize, via a telephone network, operating statuses of movable racks controlled by the control unit.
