AMINOTRIAZINE DERIVATIVES USEFUL AS TANK-BINDING KINASE INHIBITOR COMPOUNDS

FIELD OF THE INVENTION

This application relates to chemical compounds which may inhibit or otherwise modulate the activity of TANK-binding kinase (TBK1) and I-Kappa-B kinase (IKKε, IKBKE), and to compositions and formulations containing such compounds, and methods of using and making such compounds.

BACKGROUND OF THE INVENTION

TBK1 is a serine/threonine kinase with diverse roles in cancer, inflammation, and the host-pathogen response. Shen, R. R. and W. C. Hahn (2011) Oncogene 30(6): 631-641. TBK1 activates its substrates IRF3 and IRF7 transcription factors by direct phosphorylation of specific sites that induces their localization to the nucleus to drive transcription of type I IFN genes (Sankar, S., H. Chan, et al., (2006) Cell Signal 18(7): 982-993). In addition, NFkB activation can be bolstered by the kinase activity of TBK1 by phosphorylating the inhibitors of NFkB, which enables activation of the canonical or non-canonical NFkB transcription factors.

TBK1 has been implicated as being a key gene required for KRAS-dependent cancers, required for HER2+ breast cancers, and contributing to the acquisition of resistance to erlotinib. Depletion of TBK1 by shRNA results in synthetic lethality with KRAS-dependent cancer cell lines and xenograft models (Barbie, D. A., P. Tamayo, et al. (2009) Nature 462(7269): 108-112) and TBK1 is required for RAS-mediated transformation of murine embryonic fibroblasts (Ou, Y. H., M. Torres, et al. (2011) Mol Cell 41(4): 458-470). TBK1 is downstream of RAS and elicits its oncogenic properties via the RALB-NFkB and AKT pathways (Chien, Y., S. Kim, et al. (2006) Cell 127(1): 157-170). In addition, TBK1 directly phosphorylates AKT at S473 and results in the downstream activation of the mTORC1/2 pathway (Ou, Y. H., M. Torres, et al. (2011) Mol Cell 41(4): 458-470). TBK1 was also identified as being important for the survival of HER2+ breast cancer cell lines via an shRNA kinome screen and showed combination effects with the EGFR/HER2 kinase inhibitor, lapatinib (Deng, T., J. C. Liu, et al. (2014) Cancer Res 74(7): 2119-2130). Additionally, integrin alphaVbeta3 was identified as a marker of cells that are resistant to EGFR therapies and have stem-like properties. The signaling cascade required for the survival of these cells was attributed to KRAS-TALB-

TBK1-NFkB axis and inhibiting TBK1 was sufficient to block the survival of these cells. Seguin, L., S. Kato, et al. (2014), Nat Cell Biol 16(5): 457-468.

IKKε is a serine/threonine kinase and its gene amplifications have been identified in up to 30% of breast cancers. Depleting IKKε in cell lines with shRNA that have these amplifications results in their decreased viability (Boehm, J. S., J. J. Zhao, et al. (2007) Cell 129(6): 1065-1079). Overexpression of IKKε in ovarian cancer has been demonstrated to mediate resistance to cisplatin and is a poor prognostic factor (Guo, J. P., S. K. Shu, et al. (2009) Am J Pathol 175(1): 324-333).

TBK1 and IKKε are also both implicated in inflammatory responses and associated disorders. IKKε has been shown to be involved in manifestations of rheumatoid arthritis (RA) that include extracellular matrix destruction, synovial inflammation, and activation of the innate immune response (Sweeney, S. E., D. Hammaker, et al. (2005) J Immunol 174(10): 6424-6430). IKKε and IRF3 protein levels are increased in the synovium of RA patients and mice deficient in IKKε show reduced clinical signs of arthritis in a collagen-induced arthritis model as well as associated reduction of inflammation and erosion. Corr, M., D. L. Boyle, et al. (2009), *Ann Rheum Dis* 68(2): 257-263. Other inflammatory disorders that manifest as a result of Type I IFN response and upstream activation of TLR3/TLR4 or cytosolic nucleic acid sensors are likely to also rely on a TBK1/IKKε signaling axis to initiate and maintain their pathogenic state such as Sjogrens syndrome, inflammatory bowel disease (IBD), chronic obstructive pulmonary disease (COPD), systemic lupus erythematosus (SLE), dermatomyositis, polymyositis, systemic sclerosis. Baccala, R., K. Hoebe, et al. (2007), Nat Med 13(5): 543-551. Furthermore, both TBK1 and IKKε have been shown to play a role in maintaining macrophages in an activated state in response to IFN. Solis, M., R. Romieu-Mourez, et al. (2007) Eur J Immunol 37(2): 528-539.

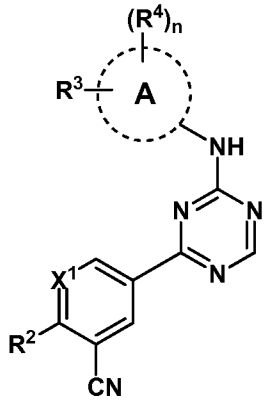

In addition to inflammation and cancer, IKKε is implicated in obesity, type 2 diabetes, and insulin resistance. Mice deficient for IKKε are protected from obesity induced by a high-fat diet, hepatic steatosis, insulin resistance, and chronic inflammation of the liver and fat. Chiang, S. H., M. Bazuine, et al. (2009) Cell 138(5): 961-975. Consistent with this, high levels of NFkB activation have been seen in the liver, adipocytes, and adipose tissue resident macrophages as well as increase levels of IKKε over healthy mice. Treatment with a kinase inhibitor to TBK1/ IKKε improved obesity-

related metabolic dysfunction in mice fed a high fat diet (Reilly, S. M., S. H. Chiang, et al. (2013) Nat Med 19(3): 313-321).

Accordingly, there is a need for inhibitors of the kinase activity of TBK1 and/or IKKε for treating cancers, inflammatory, and metabolic disorders that may have an active TBK1 and/or IKKε pathway.

Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art. It must be noted that as used herein and in the appended claims, the singular forms "a", "and", and "the" include plural referents unless the context clearly dictates otherwise. Thus, e.g., reference to "the compound" includes a plurality of such compounds and reference to "the assay" includes reference to one or more assays and equivalents thereof known to those skilled in the art, and so forth.

A wavy line drawn through a line in a structure indicates a point of attachment of a group, e.g.:

A dashed line indicates an optional bond. A dash at the front or end of a chemical group is a matter of convenience; chemical groups may be depicted with or without one or more dashes without losing their ordinary meaning. When used, a dash indicates the point of attachment, e.g. -S(O)(R^c)=NR^b indicates the following structure with point of attachment at the S:

.

Where multiple substituent groups are identified the point of attachment is at the terminal substituent (e.g. for "alkylaminocarbonyl" the point of attachment is at the carbonyl substituent).

The prefix "C_{x-y}" indicates that the following group has from x (e.g. 1) to y (e.g. 6) carbon atoms, one or more of which, in certain groups (e.g. heteroalkyl, heteroaryl, heteroarylalkyl, etc.), may be replaced with one or more heteroatoms or heteroatomic groups. For example, "C_{1-6} alkyl" indicates that the alkyl group has from 1 to 6 carbon atoms. Likewise, the term "x-y membered" rings, wherein x and y are numerical ranges, such as "3-12 membered heterocyclyl", refers to a ring containing x-y atoms (e.g. 3-12), of which up to half may be heteroatoms, such as N, O, S, P, and the remaining atoms are carbon.

Also, certain commonly used alternative chemical names may or may not be used. For example, a divalent group such as a divalent "alkyl" group, a divalent "aryl" group, etc., may also be referred to as an "alkylene" group or an "alkylenyl" group, or alkylyl group, an "arylene" group or an "arylenyl" group, or arylyl group, respectively.

Additional examples of substituent combinations used herein include: C_{1-6} alkylamiocarbonyl (e.g. $CH_3CH_2NHC(O)$-) C_{1-6} alkoxycarbonyl (e.g. CH_3O-C(O)-), 5-7 membered heterocyclyl-C_{1-6} alkyl (e.g. piperazinyl-CH_2-), C_{1-6} alkylsulfonyl-5-7 membered heterocyclyl (e.g. $CH_3S(O)_2$-morpholinyl-), 5-7 membered heterocyclyl C_{1-6} alkoxy (e.g. pyrrolidinyl-O-), 5-7 membered heterocyclyloxy, (4-7 membered heterocyclyl)-4-7 membered heterocyclyl (e.g. oxetanyl-pyrrolidinyl-), C_{3-6} cycloalkylaminocarbonyl (e.g. cyclopropyl-NH-C(O)-), 5-7 membered heterocyclyl-C_{2-6} alkynyl (e.g. N-piperazinyl-$CH_2C{\equiv}CCH_2$-), and C_{6-10} arylaminocarbonyl (e.g. phenyl-NH-C(O)-).

The term "pharmaceutically acceptable" with respect to a substance refers to that substance which is generally regarded as safe and suitable for use without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable

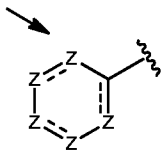

benefit/risk ratio.

The compounds described herein include isomers, stereoisomers and the like. As used herein, the term "isomers" refers to different compounds that have the same molecular formula but differ in arrangement and configuration of the atoms. Also as used herein, the term "an optical isomer" or "a stereoisomer" refers to any of the various stereo isomeric configurations which may exist for a given compound of the present invention and includes geometric isomers. It is understood that a substituent may be attached at a chiral center of a carbon atom. Therefore, the invention includes enantiomers, diastereomers or racemates of the compound.

The term “fused” refers to a ring which is bound to an adjacent ring.

"Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture.

The phrase ortho, refers to the position on the ring where the substituent is adjoined with respect to the point of attachment of the ring, and is shown below with an arrow, wherein z represents a carbon atom or nitrogen:

Similarly, “*para*” refers to attachment of a substituent at the 4-position with respect to the point of attachment of the ring and “*meta*” refers to attachment of a substituent at the 3-position with respect to the point of attachment of the ring.

The term is used to designate a racemic mixture where appropriate. "Diastereoisomers" are stereoisomers that have at least two asymmetric atoms, but which are not mirror-images of each other.

The absolute stereochemistry is specified according to the Cahn- Ingold- Prelog R-S system. When a compound is a pure enantiomer the stereochemistry at each chiral carbon may be specified by either R or S. Resolved compounds whose absolute configuration is unknown can be designated (+) or (-) depending on the direction (dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. Certain of the compounds described herein contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other

stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-. The present invention is meant to include all such possible isomers, including racemic mixtures, optically pure forms and intermediate mixtures. Optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. If the compound contains a double bond, the substituent may be E or Z configuration. If the compound contains a disubstituted cycloalkyl, the cycloalkyl substituent may have a cis- or trans-configuration. All tautomeric forms are also intended to be included.

For example a compound that has 2-10 fold greater inhibitory activity—as measured by IC_{50} values—for a desired enzyme(s), such as TBK1 and/or IKKε, as compared to the enzyme for which the compound is selective against, such as JAK2, is selective against the referenced enzyme.

Provided are also compounds in which from 1 to n hydrogen atoms attached to a carbon atom may be replaced by a deuterium atom, or tritiated with a tritium atom, in which n is the number of hydrogen atoms in the molecule. As known in the art, the deuterium atom is a non-radioactive isotope of the hydrogen atom and tritium is a radioactive isotope. Such compounds, particularly deuterated compounds, may increase resistance to metabolism, and thus may be useful for increasing the half-life of the compounds when administered to a mammal. See, e.g., Foster, "Deuterium Isotope Effects in Studies of Drug Metabolism," Trends Pharmacol. Sci., 5(12):524-527 (1984). Such compounds are synthesized by means well known in the art, for example by employing starting materials in which one or more hydrogen atoms have been replaced by deuterium.

Such transdermal patches may be used to provide continuous or discontinuous infusion of the compounds of the present invention in controlled amounts. The construction and use of transdermal patches for the delivery of pharmaceutical agents is well known in the art. See, e.g., U.S. Patent Nos. 5,023,252, 4,992,445 and 5,001,139. Such patches may be constructed for continuous, pulsatile, or on demand delivery of pharmaceutical agents.

The compositions may, in some embodiments, be formulated in a unit dosage form. The term "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient (e.g., a tablet, capsule, ampoule). In some embodiments, for oral administration, each dosage unit contains from about 10 mg to about 1000 mg of a compound described herein, for example from about 50 mg to about 500 mg, for example about 50 mg, about 75 mg, about 100 mg, about 150 mg, about 200 mg, about 250 mg, or about 300 mg. In other embodiments, for parenteral administration, each dosage unit contains from 0.1 to 700 mg of a compound a compound described herein. It will be understood, however, that the amount of the compound actually administered usually will be determined by a physician, in the light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered and its relative activity, the age, weight, and response of the individual subject, and the severity of the subject's symptoms.

In certain embodiments, dosage levels may be from 0.1 mg to 100 mg per kilogram of body weight per day, for example from about 1 mg to about 50 mg per kilogram, for example from about 5 mg to about 30 mg per kilogram. Such dosage levels may, in certain instances, be useful in the treatment of the above-indicated conditions. In other embodiments, dosage levels may be from about 10 mg to about 2000 mg per subject per day. The amount of active ingredient that may be combined with the vehicle to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. Dosage unit forms may contain from 1 mg to 500 mg of an active ingredient.

Frequency of dosage may also vary depending on the compound used and the

particular disease or condition treated. In some embodiments, for example, for the treatment of an autoimmune and/or inflammatory disease, a dosage regimen of 4 times daily or less is used. In some embodiments, a dosage regimen of 1 or 2 or 3 times daily is used. It will be understood, however, that the specific dose level for any particular subject will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, and rate of excretion, drug combination and the severity of the particular disease in the subject undergoing therapy.

For preparing solid compositions such as tablets, the principal active ingredient may be mixed with a pharmaceutical excipient to form a solid preformulation composition containing a homogeneous mixture of a compound of Formula (I), or a pharmaceutically acceptable salt, thereof. When referring to these preformulation compositions as homogeneous, the active ingredient may be dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules.

The tablets or pills of the compounds described herein may be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action, or to protect from the acid conditions of the stomach. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer that serves to resist disintegration in the stomach and permit the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol, and cellulose acetate.

Synthesis of certain compounds, and intermediates used to prepare compounds, are detailed in the following sections. Example numbers are listed for convenience.

All operations involving moisture and/or oxygen sensitive materials were conducted under an atmosphere of dry nitrogen in pre-dried glassware. Unless noted otherwise, materials were obtained from commercially available sources and used without further purification.

Nuclear magnetic resonance ("NMR") spectra were recorded on a Varian 400 MHz resonance spectrometer. 1H NMR chemical shifts are given in parts per million (δ)

downfield from tetramethylsilane ("TMS") using TMS or the residual solvent signal (CHCl3 = δ 7.24, DMSO = δ 2.50) as internal standard. 1H NMR information is tabulated in the following format: multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet), coupling constant(s) (J) in Hertz, number of protons. The prefix app is occasionally applied in cases where the true signal multiplicity was unresolved and br indicates the signal in question was broadened.

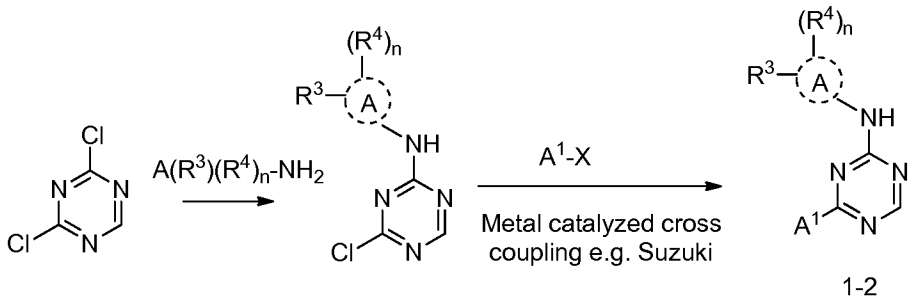

The compounds were named using ChemBioDraw Ultra Version 12.0.

A^1 is preferably:

General Scheme 3

Scheme 3 shows a general synthesis of compounds of the invention beginning with the benzonitrile (3-1), where the Fluorine displacement with nucleophiles (where Z equals Oxygen, Nitrogen or Sulfur) yield 3-2 which on with sodium methoxide gave methyl 3-cyano-4-substituted benzimidate 3-3 which was not isolated and subsequently treated with cyanamide and N-(chloromethylene)-N-methylmethanaminium chloride to give 1,3,5-triazine (3-5). Preparation of 4-amino-2-methoxybenzamide: 2-methoxy-4-nitrobenzonitrile (1.0 g, 5.6 mmol) was taken up as a suspension in ethanol/water (3:1, 15 mL). Hydrido(dimethylphosphinous acid-kP)[hydrogen bis(dimethylphosphinito-kP)]platinum(II) (Strem Chemicals, Inc., 24 mg, 56 µmol) was added. The mixture was stirred overnight in a sealed vessel at 120 °C. After cooling to room temperature, the suspension was concentrated to dryness under reduced pressure to provide the desired carboxamide, which was carried forward without further purification.

The concentrated residue was diluted with methanol and 2-methyltetrahydrofuran. The suspension was warmed with a heat gun and was then allowed to cool to room temperature. The mixture was degassed and then treated with 10 % palladium on carbon (catalytic). The mixture was shaken under 50 psi hydrogen for 3 days. The catalyst was removed by filtration through a pad of Celite diatomaceous earth. The filtrate was concentrated under reduced pressure to provide 4-amino-2-methoxybenzamide. The mixture continued to stir in the bath for about 15 minutes before the removal of the bath. The mixture was allowed to remain at room temperature. The aqueous phase was extracted twice with dichloromethane. The combined organics were washed twice with water, dried over anhydrous magnesium sulfate, filtered, concentrated to dryness under reduced pressure to provide 5-amino-2-(tetrahydro-2H-pyran-4-yloxy)benzonitrile. The crude product was carried forward without further purification.

To a solution of 2,4-dichloro-1,3,5-triazine (0.27 g, 1.8 mmol) in N,N-dimethylformamide (DMF, 2 mL) at 0 °C were added N,N-diisopropylethylamine (DIEA, 0.32 mL, 1.9 mmol), followed by a solution of 5-amino-2-(tetrahydro-2H-pyran-4-yloxy)benzonitrile (0.36 g, 1.6 mmol) in DMF (6 mL). 5-(4-((4-(1-(oxetan-3-yl)piperidin-4-yl)phenyl)amino)-1,3,5-triazin-2-yl)-2-((tetrahydro-2H-pyran-4-yl)oxy)benzonitrile

Preparation of 4-(4-nitrophenyl)piperidine: 4-Phenylpiperidine (5.5 g, 34 mmol) was dissolved in glacial acetic acid (28 mL) and stirred in an ice-water bath (internal temp < 20 °C) while a solution of 1.8 mL concentrated sulfuric acid (1.8 mL) in glacial acetic acid (28 mL) was added, followed by a solution of 90% nitric acid (1.6 mL) in acetic acid (14 mL). The cooling bath was removed and sulfuric acid (28 mL) was added without cooling, causing the internal temperature to reach a maximum of 50 °C. The mixture was allowed to stir at room temperature for about 2 hours before it was added to ice-water (~200 g) and basified with small additions of solid sodium hydrogen carbonate to ~ pH 5. The mixture was then brought to pH 14 with 50/50 (w/w) sodium hydroxide solution in an exothermic reaction. The mixture was extracted three times with dichloromethane, washed once each with 1 % aqueous sodium hydroxide solution and saturated with sodium chloride, dried over anhydrous magnesium sulfate, filtered, and concentrated under reduced pressure. The gummy residue was triturated with refluxing cyclohexane. The resulting powder was collected by vacuum filtration to provide 4-(4-nitrophenyl)piperidine.

Preparation of 4-(4-nitrophenyl)-1-(oxetan-3-yl)piperidine: 3-iodooxetane (Astatech, 1.9 g, 10 mmol) was added via syringe to a suspension of 4-(4-nitrophenyl)piperidine (1.1 g, 5.2 mmol) and potassium carbonate (0.72 g, 5.2 mmol) in acetonitrile. Vial was sealed. The mixture was stirred with heating in a sealed vessel on a 125 °C. After five hours, an additional quantity of potassium carbonate (0.72 g, 5.2 mmol) was added. The mixture was heated overnight. After cooling to room temperature, the mixture was filtered through a pad of Celite diatomaceous earth, eluting with dichloromethane and acetonitrile. The filtrate was concentrated to dryness under reduced pressure to provide 4-(4-nitrophenyl)-1-(oxetan-3-yl)piperidine, which was carried forward without further purification. Preparation of 4-(1-(oxetan-3-yl)piperidin-4-yl)aniline: Crude 4-(4-nitrophenyl)-1-(oxetan-3-yl)piperidine (5.2 mmol assumed) was taken up in methanol (10 mL) with a heat gun. After cooling, the mixture was degassed, then treated with 10 % palladium on

carbon (150 mg). The mixture was stirred for 5 hours under a balloon of hydrogen. The mixture was filtered through a pad of Celite diatomaceous earth. The filtrate was concentrated under reduced pressure. The residue was re-dissolved in methanol (approximately 50 mL). After the mixture was degassed, it was treated with 10 % palladium on carbon (150 mg). The mixture was shaken overnight under 45 psi hydrogen. The mixture was filtered through a pad of Celite diatomaceous earth. The filtrate was concentrated under reduced pressure to provide the desired product.

After one hour, the mixture was partitioned between ethyl acetate and saturated aqueous sodium hydrogen carbonate solution. A solid was collected by filtration and discarded. The aqueous phase was extracted three times with ethyl acetate, The combined organics were washed once each with water and saturated aqueous sodium chloride solution, dried over anhydrous magnesium sulfate, filtered, concentrated under reduced pressure and then purified by flash chromatography on silica gel to provide 4-chloro-*N*-(4-(1-(oxetan-3-yl)piperidin-4-yl)phenyl)-1,3,5-triazin-2-amine.

Example 241: 2-(((3R,4S)-3-fluoro-1-(2-hydroxyacetyl)piperidin-4-yl)oxy)-5-(4-((4-((S)-3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)benzonitrile

To a stirred solution of 1-fluoro-4-nitrobenzene (634mg, 4.5 mmol) in DMSO was added (S)-tert-butyl 2-methylpiperazine-1-carboxylate (1000 mg, 5 mmol) followed by DIPEA (1.2mL, 10 mmol). The mixture was heated at 160 °C for 4 hrs, and then cooled to room temperature. The mixture was then poured into water and extracted with DCM. The combined organic layers were concentrated in vacuo to obtain (S)-tert-butyl 2-methyl-4-(4-nitrophenyl)piperazine-1-carboxylate.

(S)-tert-butyl 2-methyl-4-(4-nitrophenyl)piperazine-1-carboxylate was dissolved with a mixture of DCM and TFA and stirred at room temperature for 1hr. Reaction mixture was evaporated under reduced pressure and solids were re-dissolved in DCM and then poured slowly into a stirred saturated aqueous solution of $NaHCO_3$ and extracted three times with DCM. The organic layer was evaporated and concentrated in vacuo to obtain (S)-3-methyl-1-(4-nitrophenyl)piperazine.

To a mixture of (S)-3-methyl-1-(4-nitrophenyl)piperazine (620mg, 3 mmol), zinc chloride (495mg, 4 mmol), oxetan-3-one (2.0 g, 28mmol) in methanol was added $NaBH_3CN$ (434mg, 7mmol). The mixture was stirred at 75 °C for 2 hours. Reaction mixture was diluted with 1N HCl in water. It was extracted with dichloromethane three times and the combined organic layer was discharged. To aqueous layer a saturated aqueous solution of NaHCO3 was added in portions. It was extracted with DCM three times and the combined organic layer was evaporated under reduced pressure to obtain (S)-2-methyl-4-(4-nitrophenyl)-1-(oxetan-3-yl)piperazine.

To a stirred solution of (S)-2-methyl-4-(4-nitrophenyl)-1-(oxetan-3-yl)piperazine (610mg, 2.2 mmol) in ethanol was added Fe (615mg, 11mmol) followed by an saturated aqueous solution of ammonium chloride (3.1 ml). The mixture was stirred at 60°C for 3hrs then

cooled to room temperature and filtered thought celite. The filtrate was poured into a saturated aqueous solution of $NaHCO_3$ and extracted with DCM three times. The combined organic layers were evaporated and concentrated in vacuo to obtain (S)-4-(3-methyl-4-(oxetan-3-yl)piperazin-1-yl)aniline.

To a solution of 2,4-dichloro-1,3,5-triazine (109mg, 0.7mmol) in DMF at 0 °C (flushed with Argon) was added a solution of (S)-4-(3-methyl-4-(oxetan-3-yl)piperazin-1-yl)aniline (200mg, 0.8mmol) in DMF over 15 min and stirred in an ice-bath for 1h.
Reaction mixture was poured into a saturated aqueous solution of $NaHCO_3$ and extracted with DCM three times. The combined organic layers were evaporated and concentrated in vacuo to obtain (S)-4-chloro-N-(4-(3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)-1,3,5-triazin-2-amine.

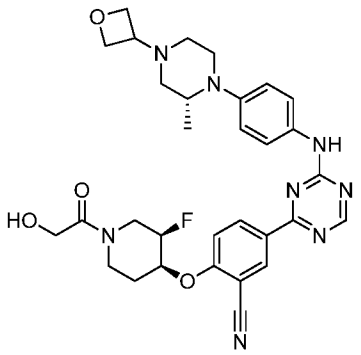

To (S)-4-chloro-N-(4-(3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)-1,3,5-triazin-2-amine (120mg, 0.33mmol), 2-fluoro-5-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)benzonitrile (90mg, 0.36mmol), $Pd(dppf)Cl_2CH_2Cl_2$ (30mg) and potassium carbonate (92mgs, 0.67mmol) mixture in argon atmosphere was added a mixture of de-gassed solvents (DME and water 2:1). The mixture was stirred under argon atmosphere at 104 °C for 40min.After cooling at room temperature; reaction mixture was poured into water and extracted with DCM. The combined organic layers were evaporated and concentrated in vacuo to obtain (S)-2-fluoro-5-(4-((4-(3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)benzonitrile.
A solution of a (3R,4S)-tert-butyl 3-fluoro-4-hydroxypiperidine-1-carboxylate (81mg, 0.3 mmol) in THF (5 mL) was stirred in an ice-water bath under an atmosphere of Argon. Potassium tert-butoxide (1.0 M, 0.37 ml, 0.38mmol) was added in a single portion and the mixture was stirred at 0 °C for 40 minutes, and then (S)-2-fluoro-5-(4-((4-(3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)benzonitrile was added (83mgs, 0.19mmol). The mixture was stirred for 1hr at 60 °C. After the mixture cooled to room temperature, water was added, and mixture evaporated under reduced pressure to yield the crude (3R,4S)-tert-butyl 4-(2-cyano-4-(4-((4-((S)-3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)phenoxy)-3-fluoropiperidine-1-carboxylate.

Reaction mixture was stirred at room temperature for 1hr. Reaction mixture was evaporated under reduced pressure and solids were re-dissolved in DCM and a saturated aqueous solution of $NaHCO_3$ was added. Organics were

collected dried over magnesium sulfate and evaporated under reduced pressure to yield 2-(((3R,4S)-3-fluoropiperidin-4-yl)oxy)-5-(4-((4-((S)-3-methyl-4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)benzonitrile.

Solids were purified via preparative HPLC (5-65% acetonitrile in water, 0.1% trifluoroacteic acid buffer). Fractions containing desired product were collected and DCM and a saturated aqueous solution of $NaHCO_3$ were added. yl)oxy)-5-(4-((4-(4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)benzonitrile

Step1: Preparation of (3R,4S)-tert-butyl 4-(4-bromo-2-cyano-6-fluorophenoxy)-3-fluoropiperidine-1-carboxylate: PS-PPh_3 resin (5.34 g, 20.4 mmol 4.4 equiv) was added to a dried 500 mL RBF that was then capped and flushed with nitrogen. The resin was suspended in 75 mL of anhydrous THF. After a period of 2 min, 5-bromo-3-fluoro-2-hydroxybenzonitrile (1 g, 4.63 mmol) dissolved in 38 mL of anhydrous THF was added in a single portion. The resultant suspension was mixed briefly, after which a solution of DEAD was added in a single portion. This mixture was then agitated on an orbital shaker for 30min, after which a solution of 3R,4R)-tert-butyl 3-fluoro-4-hydroxypiperidine-1-carboxylate (1.27 g, 5.79 mmol) in THF (38 ml) was added in a single portion. The reaction mixture was then stirred 3 h. Then another portion of DEAD was added. The stirring was maintained overnight. The resultant suspension was filtered, and the resin was washed with THF. The filtrate was evaporated in vacuum. Solids were dissolved in DCM and water was added. The organic phase was evaporated under reduced pressure and purified by silica gel column chromatography with EtOAc in hexanes to give the product.

Step2: Preparation of (3R,4S)-tert-butyl 4-(2-cyano-6-fluoro-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenoxy)-3-fluoropiperidine-1-carboxylate: (3R,4S)-tert-butyl 4-(4-bromo-2-cyano-6-fluorophenoxy)-3-fluoropiperidine-1-carboxylate (750 mg, 1.8 mmol), potassium acetate (530 mg, 5.4 mmol), bis(pinacolato)diboron (913 mg, 3.6 mmol), and Pd(dppf)Cl2 (133 mg, 0.18 mmol) were combined in a sealed tube. 1.4-dioxane (25 mL) was added and the mixture was heated at 90 °C overnight. After cooling down, the mixture was filtered through a pad of Celite, eluting with 1,4-dioxane. The filtrate was concentrated to dryness under reduced pressure and the residue was purified by a silica gel column with the ESCO system with 0-5% MeOH in CH2Cl2 to give the product.

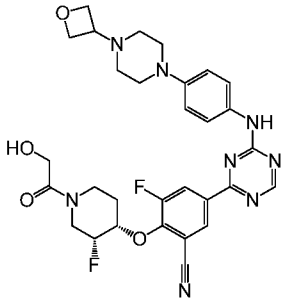

Step 3: Preparation of (3R,4S)-tert-butyl 4-(2-cyano-6-fluoro-4-(4-((4-(4-(oxetan-3-

The mixture was run under microwave at 130 °C for 75 minutes. Then the reaction mixture was diluted with a mixture of DCM and MeOH (1:1), filtered through a pad of Celite. The biphasic filtrate was concentrated under reduced pressure. Ethanol was added and concentrated. The residue was passed over a silica gel column with 5-15% MeOH in CH2Cl2 to give the product. Step 1: Preparation of (3R,4S)-tert-butyl 4-(4-bromo-2-cyano-6-methylphenoxy)-3-fluoropiperidine-1-carboxylate: PS-PPh_3 resin (8.16 g, 31.1 mmol, 4.4 equiv) was added to a dried 500 mL RBF that was then capped and flushed with nitrogen. The resin was suspended in 110 mL of anhydrous THF. After a period of 2 min, 5-bromo-2-hydroxy-3-methylbenzonitrile (1.5 g, 7.07 mmol) dissolved in 60 mL of anhydrous THF was added in a single portion. The resultant suspension was mixed briefly, after which a solution of DEAD (1.97 g, 11.3 mmol) was added in a single portion. This mixture was then stirred for 30min, after which a solution of (3R,4R)-tert-butyl 3-fluoro-4-hydroxypiperidine-1-carboxylate (1.94 g, 8.84 mmol) in THF (60 mL) was added in a single portion. The reaction mixture was then stirred 3 h. Then another portion of DEAD was added. The stirring was maintained overnight. The resultant suspension was filtered, and the resin was washed with THF. The filtrate was evaporated in vacuum. Solids were dissolved in DCM and water was added. The organic phase was evaporated under reduced pressure and purified by silica gel column chromatography with EtOAc in hexanes to give the product.

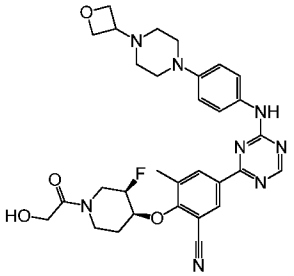

Step 2: Preparation of (3R,4S)-tert-butyl 4-(2-cyano-6-methyl-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenoxy)-3-fluoropiperidine-1-carboxylate: (3R,4S)-tert-Butyl 4-(4-bromo-2-cyano-6-methylphenoxy)-3-fluoropiperidine-1-carboxylate (1.91 g, 4.62 mmol), potassium acetate (1.36 g, 13.86 mmol), bis(pinacolato)diboron (2.347 g, 9.24 mmol), and $Pd(dppf)Cl_2$ (343 mg, 0.462 mmol) were combined in a sealed tube. 1.4-Dioxane (50 mL) was added and the mixture was heated at 90 °C overnight. After cooling down, the mixture was filtered through a pad of Celite, eluting with 1,4-dioxane. The filtrate was concentrated to dryness under reduced pressure and the residue was purified by a silica gel column with 0-30% EtOAc in hexanes to give the product.

Step 3: Preparation of (3R,4S)-tert-butyl 4-(2-cyano-6-methyl-4-(4-((4-(4-(oxetan-3-yl)piperazin-1-yl)phenyl)amino)-1,3,5-triazin-2-yl)phenoxy)-3-fluoropiperidine-1-carboxylate: To a mixture of the (3R,4S)-tert-butyl 4-(2-cyano-6-methyl-4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenoxy)-3-fluoropiperidine-1-carboxylate (1.25g, 2.7 mmol), 4-chloro-N-(4-(4-(oxetan-3-yl)piperazin-1-yl)phenyl)-1,3,5-triazin-2-amine (945 mg, 2.7 mmol), and $Pd(PPh_3)_4$ (236 mg, 0.204 mmol) in 1,2-DME (12 mL) , was added 2M sodium carbonate solution (6.1 mL). The mixture was run under microwave at 130 °C for 75 minutes. Then the reaction mixture was diluted with a mixture of DCM and MeOH (1:1), filtered through a pad of Celite. The biphasic filtrate was concentrated under reduced pressure. Ethanol was added and concentrated. The residue was passed over a silica gel column with 5-15% MeOH in CH_2Cl_2 to give the product. The reaction mixture was stirred at room temperature overnight. The mixture was concentrated under reduced pressure and the residue was used for next step. Biological Assays:

TBK1 and IKKε:

Enzymatic activity of IKKε and TBK1 was measured using a homogeneous time resolved fluorescence resonance energy transfer (TR-FRET) assay that monitors enzyme dependent phosphorylation of a biotinylated serine/threonine peptide substrate. An increase in the amount of phopshorylated peptide results in an increase in TR-FRET signal. TBK1 and IKKε were expressed and purified as full length recombinant proteins. Detection reagents for the assay were purchased from Cisbio. TBK1 and IKKε enzymes were assayed under initial rate conditions in the presence of 2X Km ATP (40-80 μM) and 1 μM peptide, hepes (pH 7), 0.1mM orthovanadate, 0.02% NaN3, 0.01% BSA, 10mM MgCl2, 0.01% (v/v) tritonX, 1mM dithiothreitol, 0.5% (v/v) DMSO at the following concentrations for each enzyme: TBK1 at 2.5 nM and IKKε at 0.3 nM. After an assay reaction time of 240 minutes at 25°C, reactions were terminated with EDTA.

Amount of phosphorylated peptide was determined by the addition of 125 nM streptavidin XL665 and europium cryptate labeled anti-phospho monoclonal antibody and the resulting TR-FRET signal was recorded on an Envision plate reader (Ex: 340 nm; Em: 615/665 nm; 100μs delay and 200μs read window). Data was normalized based on a positive (1μM Staurosporine) and negative (DMSO) controls and IC50

values calculated from the fit of the dose−response curves to a four-parameter equation. All IC50 values represent geometric mean values of a minimum of four determinations. These assays generally produced results within 3-fold of the reported mean.

hJAK2:

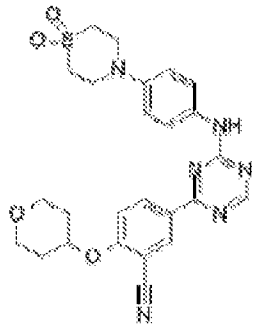

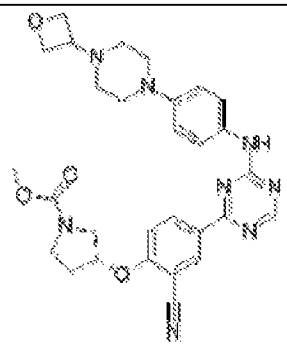

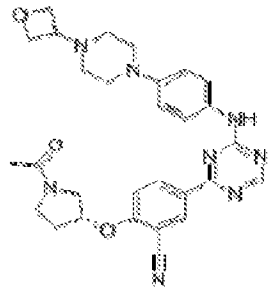

Enzymatic activity of hJAK2 was measured using a LANCE® homogeneous time resolved fluorescence resonance energy transfer (TR-FRET) assay that monitors enzyme dependent phosphorylation of a biotinylated serine/threonine peptide substrate (PTK). An increase in the amount of phopshorylated peptide results in an increase in TR-FRET signal. hJAK2 was expressed and purified as full length recombinant proteins. Detection reagents for the assay were purchased from PerkinElmer. hJAK2 enzyme was assayed under initial rate conditions in the presence of 2X Km ATP (30 μM) and 1 μM peptide, 50 mM Tris-Cl (pH 7.5), 10mM MgCl2, , 1mM dithiothreitol, 0.01% BSA, 0.05% (v/v) DMSO at the following concentration of enzyme: hJAK2 at 0.3 nM. After an assay reaction time of 40 minutes at 25°C, reactions were terminated with EDTA and LANCE Detection Buffer.

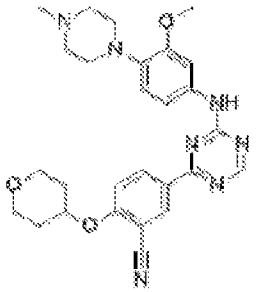

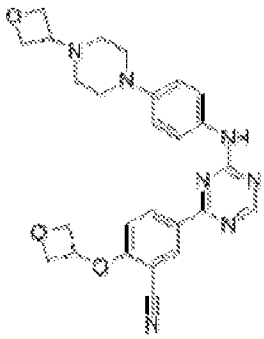

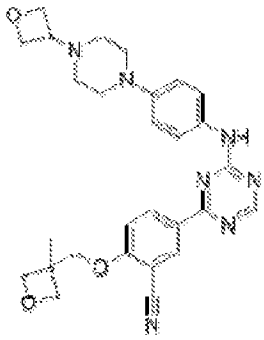

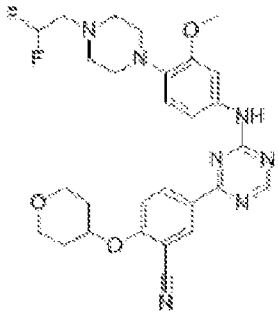

Amount of phosphorylated peptide was determined by the addition of 20 nM SA-APC and 1 nM europium cryptate labeled anti-phospho PTK monoclonal antibody PY66 and the resulting TR-FRET signal was recorded on an Envision plate reader (Ex: 340 nm; Em: 615/665 nm; 100µs delay and 200µs read window). Data was normalized based on a positive (1µM Staurosporine) and negative (DMSO) controls and IC50 values calculated from the fit of the dose−response curves to a four-parameter equation. All IC50 values represent geometric mean values of a minimum of four determinations. These assays generally produced results within 3-fold of the reported mean.
