

ELECTRICAL APPLIANCES AND COLLECTION SYSTEM FOR ELECTRICAL APPLIANCES
ABSTRACT

An electrical appliance which after the body thereof has been worn out can be collected and reclaimed, or reverted to raw materials, is provided together with to a collection system for such an electrical appliance. A trade mark representation displayed on one or both of the electrical appliance body and the packaging; an environmental protection mark displayed on one or both of the surface of the electrical appliance body and the packaging thereof; and an environmental protection cooperation organisation representation displayed on one or both of the electrical appliance body and the packaging, in the vicinity of the environmental protection mark are provided. After the useful life, the discarded electrical appliance body is collected and is not immediately treated as rubbish but is reclaimed or reverted to raw materials.

The environmental protection cooperation organisation representation 4 is displayed sufficiently close to the environmental protection mark 3 as to not cause confusion with the trade mark representation 12 denoting the electrical appliance body. Therefore a person dealing with the electrical appliance can recognise that the environmental protection mark 3 and the environmental protection cooperation organisation representation 4 are both not related to the contents, and support for the collection of the electrical appliance can thus be facilitated.
