

ABSTRACT

The lifting apparatus allows the removal of the rotor block (2) from the housing (14) in a horizontal direction. The lifting apparatus comprises a cantilever (6), which is fastened on a vertical stop, i.e. on an axial end, of the housing (14), and on which there is arranged a structure (5) which can be moved along the cantilever and which is likewise fastened on a vertical stop, i.e. an axial end of the rotor block (2).
