

**ABSTRACT OF THE DISCLOSURE**

This bracelet clasp comprises two branches (1, 2) which are articulated to one another by a respective first one of their ends in order to make it possible to fold a first one of these branches over and/or into the second of said branches, and to unfold it in order to place it substantially in the extension of this second branch, while their respective second ends are intended to be connected to two ends of a bracelet, these two branches (1, 2) including mutual attaching means (4, 10) for holding them in the folded position. The second end of the first articulated branch (1) includes linking means (9) having parallel axes of articulation, one for connecting these linking means to this first articulated branch (1) and at least a second one for connecting these linking means (9) firstly to one end of the bracelet and secondly to an actuating member (18) for exerting a force capable of separating said mutual attaching means (4, 10).
