

Abstract

Data Transmission Method and Device

5 The present application discloses a method and device for transmitting data, which may
obtain frequency diversity gain and further improve reliability of transmission. The method
includes: determining a plurality of carriers or carrier groups for transmitting duplicated data
according to a plurality of logical channels for carrying the duplicated data, wherein at least two
logical channels in the plurality of logical channels correspond to different carriers or carrier
10 groups for transmitting the duplicated data; and transmitting the duplicated data carried in the
plurality of logical channels respectively on the plurality of carriers or carrier groups.
