

ABSTRACT

Disclosed in embodiments of the present disclosure are a method for determining multi-carrier frequency carrier phase positioning capability and an apparatus. The method comprises: a terminal device sends positioning capability information to a network side device, wherein the positioning capability information is used for indicating capability information of multi-carrier frequency positioning signal transmission (S21). The terminal device is supported to report the positioning capability information, so as to improve the flexibility of the terminal device and improve the accuracy of positioning measurement.
