(54) Title: LOCKING BRACKET

(57) Abstract: A bracket uses a base and a locking body to attach an element to a structure. The base is attachable to the structure and defines an aperture for receiving the element. The locking body defines an opening adapted to receive the element. The locking body defines an engagement surface positioned within the opening. The engagement surface is adapted to secure the element to the base through mechanical engagement. The locking body is movable between a first position wherein the opening is not aligned with the aperture, and a second position wherein the opening aligns with the aperture. The engagement surface is engagable with the element when the locking body is in the second position.
