

[Abstract]

A parking fee management device (10) is a device configured to manage a parking fee of a parking lot. The parking fee management device (10) includes an estimation unit (25) configured to estimate a vehicle exit peak time during which outgoing vehicles are concentrated; and a discount information creation unit (26) configured to create discount information including time ranges and discount rates or discount amounts associated with each other based on a result estimated by the estimation unit (25). The discount information creation unit (26) sets a discount rate or a discount amount applied to a time other than the vehicle exit peak time to be higher than a discount rate or a discount amount applied to the vehicle exit peak time.
