(54) Title: ENROLLMENT APPARATUS, SYSTEM, AND METHOD

FIG 1

(57) Abstract: An apparatus for enrolling a package is disclosed including a receiving surface for receiving the package, at least one weight sensor in communication with the receiving surface which generates a weight signal indicative of the weight of the package, at least one video camera which generates a video signal indicative of an image of the package on the receiving surface, and a processor in communication with the at least one weight sensor and the at least one video camera. The processor includes a weight module which produces, in response to the weight signal, weight data indicative of the weight of the package, and a dimension capture module which produces, in response to the video signal, dimension data indicative of the size of the package. In some embodiments, the processor further includes a recognition module which produces character data indicative of one or more characters present on the package.
