ABSTRACT

A METHOD FOR PROCESSING A DIGITAL VIDEO AUDIO SIGNAL

A method is disclosed of decoding audio data, encoded in multiple DIF blocks in a Digital Video (DV) data stream, and outputting said audio data as a PCM frame, including the following steps:

- 5 (i) fetching a single Digital Interface Frame (DIF) block from the DV data stream;
- (ii) de-shuffling a first byte in the single DIF block to determine its index (n) in the PCM frame;
- (iii) repeating step (ii) until the last byte in the single DIF block is processed;
- (iv) writing the de-shuffled data into the PCM frame for output if the present DIF block
- 10 is the last in the present DV frame;
- (v) repeat steps (i) to (iv).

Also disclosed is apparatus arranged to perform the method, and de-shuffling equations to perform the de-shuffling of the data.
