

EXTENSION TOOL

ABSTRACT

An extension tool including a base link comprising the proximal end, wherein the base link includes a first bend. The extension tool includes a transition section coupled to the base link and including a second bend and a plurality of sequentially arranged links coupled to the transition section and moveable relative to one another and including a third bend. The extension tool includes a support member comprising the distal end, the support member including a wheel disposed at the distal end, where the support member includes a fourth bend. The first bend of the base link extending in a first direction from a longitudinal centerline, while the second bend and the fourth bend extend in a second direction substantially along the longitudinal centerline bending downward, and the third bend of the plurality of sequentially arranged links extends in a third direction from the longitudinal centerline bending upward.
