AUTOMATICALLY FREEZING FUNCTIONALITY OF A COMPUTING ENTITY RESPONSIVE TO AN ERROR

Abstract

An arrangement for facilitating error handling of computing environments (100), including those environments (100) having file systems. Responsive to an entity of the computing environment, such as a client (110) of a file system, obtaining, in a step (200), at least an indication of an error, a portion of functionality of the entity is automatically frozen in a step (202). The obtaining is, for instance, responsive to an event of another entity of the computing environment, such as a server (112) of the file system. Eventually, the frozen functionality is thawed, at a step (206) allowing the functionality to proceed.
