

ABSTRACT

An overhead transport vehicle (1) travels along a travel rail (2) and conveys a FOUP (90) including a removable lid (93) in a suspended state. The overhead transport vehicle includes a holder (11) configured to grip the FOUP with the lid oriented in a width direction crossing the traveling direction, a pair of frames (8, 8) provided at the front and the back in the traveling direction relative to the holder, and a first lid drop-preventing member (20) pivotable along a horizontal plane about a pivot shaft in the vertical direction, between an advanced position (P1) in front of the lid and a retracted position (P2) at a position retracted from the front of the lid.
