ABSTRACT OF THE DISCLOSURE

AUTOMATED IDENTIFICATION OF AMOUNTS IN TRANSACTIONS FOR TRANSACTION RECORDS

Embodiments of the invention are directed to systems and methods for identifying tax amounts in transactions for association with transaction records. A user may conduct a transaction and receive a receipt for the transaction. The user may use an application running on a portable communication device to view transaction information for their account and select a transaction associated with the receipt. The mobile communication device may identify a total transaction amount and a tax amount for the transaction based on an image of the receipt. The mobile communication device may transmit these amounts to an issuer computer that may associate the tax amount with a record of the transaction. As such, the issuer computer can maintain the tax amounts for the transactions of the user.
