ABSTRACT OF THE DISCLOSURE

DOUBLE-DECKED BABY BED

A double-decked baby bed comprises: a folding bedstead; a plurality of soft fabric layers disposed around the bedstead and on the bottom of the bedstead; a folding bedplate for detachably attaching to the bedstead; and two plates for detachably attaching to the fabric layers. The fabric layers have a plurality of coupling parts on opposite short sides. The plates have a plurality of coupling parts on opposite short sides corresponding to the coupling parts of the fabric layers. As a result, the height of the folding bedplate is adjustable by connection or disconnection of the plates when the folding bedstead is unfolded.
