

IMPROVED IMMUNOGENICITY ASSAYS

Abstract

The present invention relates to improved immunogenicity assays and methods for performing the same. In particular, the present invention relates to improved immunogenicity assays that are capable of distinguishing neutralizing anti-drug antibodies from non-neutralizing anti-drug antibodies. More in particular, the present invention relates to improved immunogenicity assays that allow (amounts and/or concentrations of) neutralizing anti-drug antibodies to be detected and/or measured in a sample even in the presence of non-neutralizing anti-drug antibodies.
