

PPDU UPLINK BANDWIDTH INDICATION METHOD AND RELATED APPARATUS

ABSTRACT

This application relates to the wireless communications field, for example, is applicable to a wireless local area network supporting the 802.11be standard, and in particular, to a PPDU uplink bandwidth indication method and a related apparatus. The method includes: An AP generates and sends a trigger frame. The trigger frame carries first indication information, where the first indication information directly indicates or jointly indicates an EHT TB PPDU bandwidth or an uplink PPDU total transmission bandwidth. The trigger frame carries second indication information, where the second indication information indicates distribution of an HE TB PPDU and/or an EHT TB PPDU in the uplink PPDU total transmission bandwidth, or directly indicate whether an EHT station transmits an HE TB PPDU or an EHT TB PPDU. According to embodiments of this application, the trigger frame is capable of triggering the EHT station to perform uplink data transmission on a bandwidth greater than 160 MHz while ensuring compatibility of the trigger frame.
