(54) Title: AN ARRANGEMENT AND A METHOD FOR INTERACTING WITH AN INTERNAL BODY ORGAN

a

b

(57) Abstract: The present invention relates to an arrangement and a method for interacting with an internal body organ. The arrangement comprises a sheath in which at least two elongate structural elements are inserted. The structural elements each have a proximal end and a distal end. The sheath has a proximal end and a distal end, said distal end being open. When the structural elements are displaced relative to the sheath they extend through the open distal end of the sheath and at least partly in the transverse direction away from the sheath for distending and/or expanding interaction between the distal end of each structural element and a body organ.
