(54) Title: TRANSCLERAL LASER

FIG. 1A

(57) Abstract: Described are optical probes for application of laser light to at least the pars plana and optionally other regions, such as the trabecular meshwork, pars plicata, and/or ciliary sulcus, of an eye, such as for treatment of glaucoma, to reduce intraocular pressure (IOP), to improve outflow of aqueous humor from the eye, and/or reduce buildup of aqueous humor within the eye. The optical probes can be adapted for simultaneously treating multiple different regions, tissues, or bodies of the eye, or for sequentially treating multiple different regions, tissues, or bodies of the eye.
