Text of the abstract

A medical device, comprising a hub or housing having a push tab disposed on an upper surface of the hub or housing; and a rib or a plurality of ribs disposed on an upper surface of the hub or housing, the rib having a top surface and being proximal to the push tab; and a cannula directly or indirectly connected to the hub or housing, wherein the top surface of the rib has a cradle shape for resisting rotation of the hub or housing when contacted by a user's finger.
